

Digital Signal Processing

Arak University of Technology

By: Dr. Moein Ahmadi

What is Signal Processing?

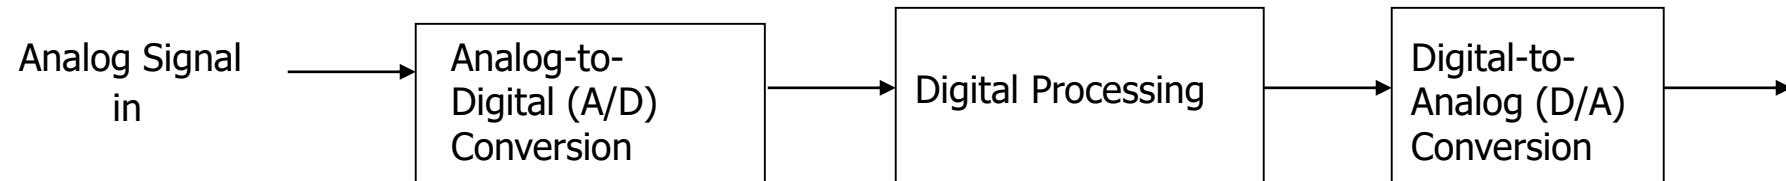

- Example of Signals:
 - Analog: Speech, Music, Photos, Video, Radar, Sonar, ...
 - Discrete-domain/Digital:
 - digitized speech, digitized music, digitized images, digitized video, digitized radar and sonar signals,...
 - stock market data, daily max temperature data, ...

Digital Signal Processing and ADC

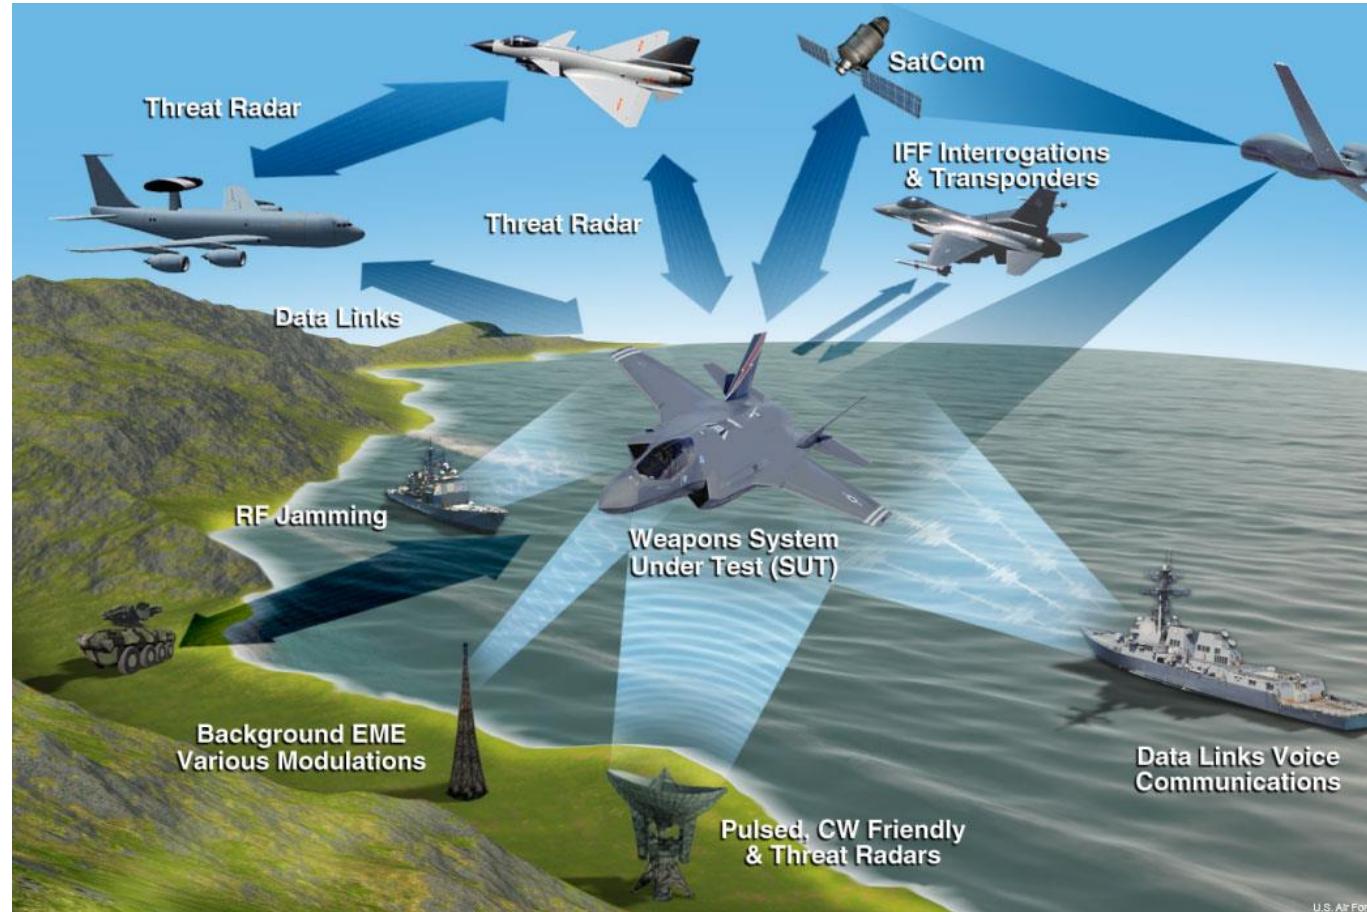

Operation, Transformation performed
on digital signals (using a computer or
other special-purpose digital hardware)

- But what about analog signals?

Communications System Block Diagram

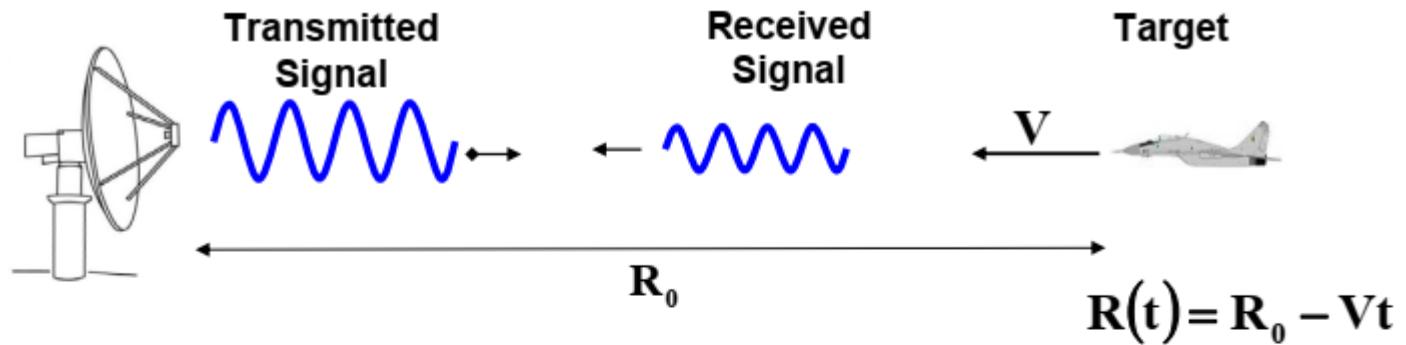

General System- Phased Array Radar

Example- Radar System

Example- Radar Basics

Transmitted Signal:

$$s_T(t) = A(t) \exp(j 2\pi f_0 t)$$

Received Signal:

$$s_R(t) = \alpha A(t - \tau) \exp[j 2\pi (f_0 + f_D)t]$$

Amplitude

Depends on RCS, radar parameters, range, etc.

Angle

Azimuth and Elevation

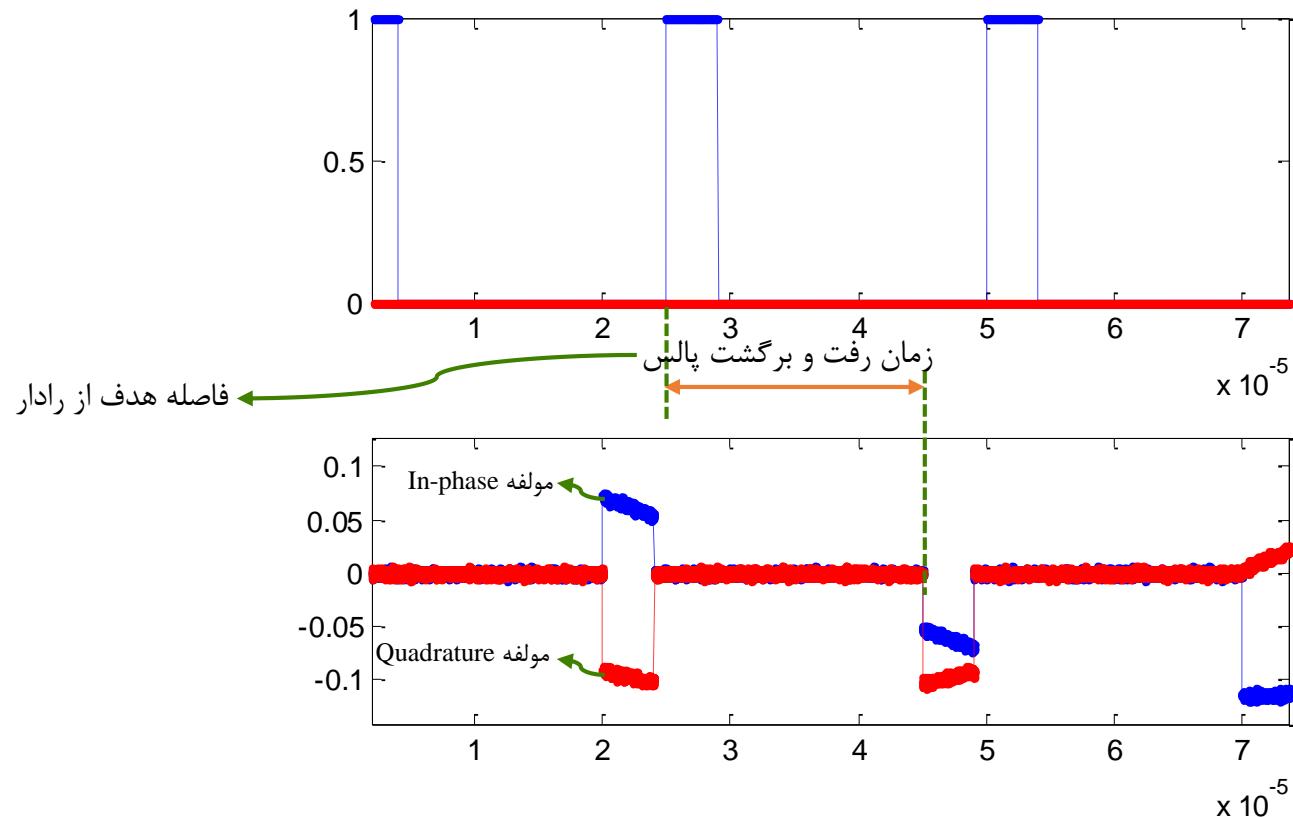

Time Delay

$$\tau = \frac{2R_0}{c}$$

Doppler Frequency

$$f_D = \frac{2Vf_0}{c} = \frac{2V}{\lambda}$$

Signal Processing Topics

Audio and Acoustic Signal Processing	Quantum Signal Processing
Biomedical Signal and Image Processing	Remote Sensing and Signal Processing
Compressive Sensing, Sampling, and Dictionary Learning	Sensor Array & Multichannel Signal Processing
Design and Implementation of Signal Processing	Signal Processing for Big Data
Financial Signal Processing	Spoken language processing
Graph Theory and Signal Processing	Signal Processing for Communication and Networking
Image, Video and Multidimensional	Signal Processing for Cyber Security
Industrial Signal Processing	Signal Processing for Education
Information Forensics and Security	Signal Processing for Smart Systems
Internet of Things & RFID	Signal Processing Implementation
Machine Learning for Signal Processing	Signal Processing Theory and Methods
Multimedia Signal Processing	Speech Processing

Signal Processing Topics

- Audio and acoustic signal processing
- Speech and language processing
- Image and video processing
- Multimedia signal processing
- Signal processing theory and methods
- Sensor array and multichannel signal processing
- Signal processing for communications

- Signal processing for education
- Bioinformatics and genomics
- Signal processing for big data
- Signal processing for the internet of things
- Design/implementation of signal processing systems

- Radar and sonar signal processing
- Signal processing over graphs and networks
- Nonlinear signal processing
- Statistical signal processing
- Compressed sensing and sparse modelling
- Optimization methods

- Machine learning
- Bio-medical image and signal processing
- Signal processing for computer vision and robotics
- Computational imaging / spectral imaging
- Information forensics and security
- Signal processing for power systems

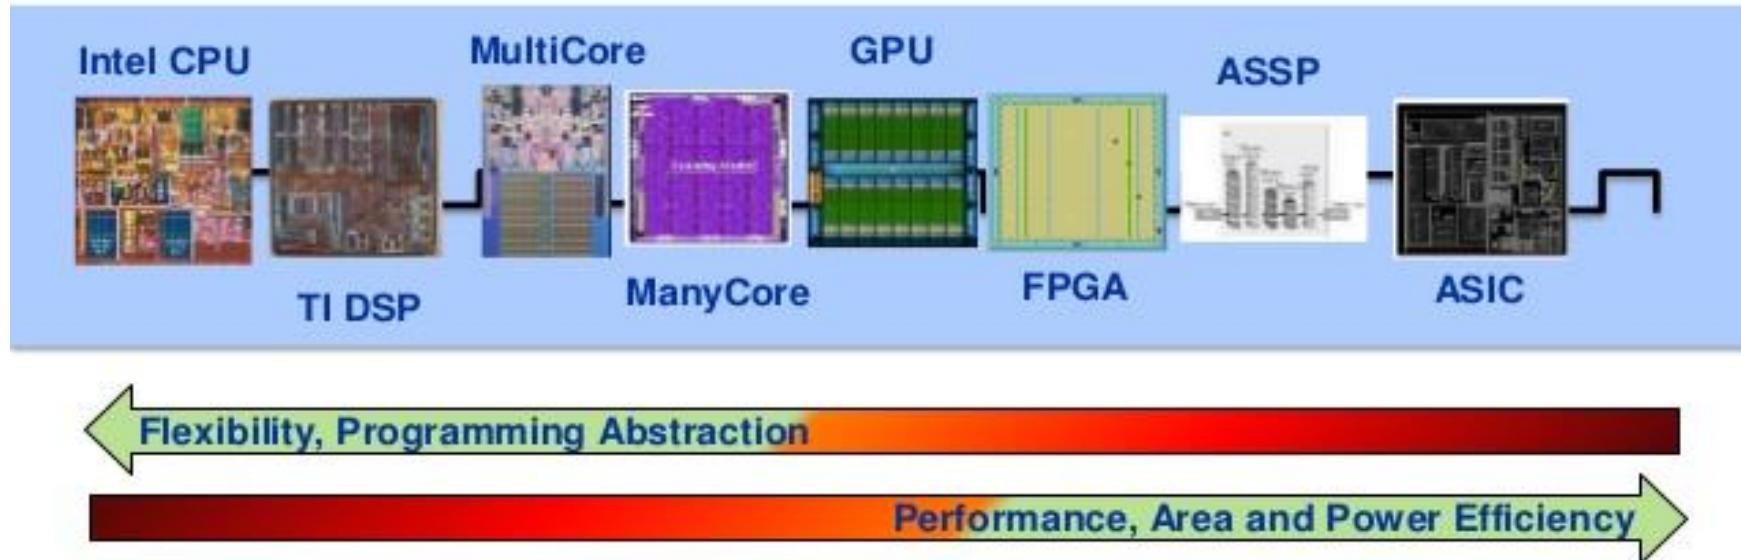

Signal Processing Topics

- Adaptive beamforming
- Array processing for biomedical applications
- Array processing for communications
- Big data
- Blind source separation and channel identification
- Computational and optimization techniques
- Compressive sensing and sparsity-based signal processing
- Detection and estimation
- Direction-of-arrival estimation
- Distributed and adaptive signal processing
- Intelligent systems and knowledge-based signal processing
- Microphone and loudspeaker array applications
- MIMO radar
- Multi-antenna systems: multiuser MIMO, massive MIMO and space-time coding
- Multi-channel imaging and hyperspectral processing
- Multi-sensor processing for smart grid and energy
- Non-Gaussian, nonlinear, and non-stationary models
- Optimization techniques
- Performance evaluations with experimental data
- Radar and sonar array processing
- Sensor networks
- Source Localization, classification and tracking
- Synthetic aperture techniques
- Space-time adaptive processing
- Statistical modelling for sensor arrays
- Tensor signal processing
- Waveform diverse sensors and systems

Related Courses

- Array Processing, Direction Finding, Interference Nulling

DSP Implementation Hardware

- CPU:**
- Market-agnostic
 - Accessible to many programmers (C++)
 - Flexible, portable

- FPGA:**
- Somewhat Restricted Market
 - Harder to Program (Verilog)
 - More efficient than SW
 - More expensive than ASIC

- ASIC**
- Market-specific
 - Fewer programmers
 - Rigid, less programmable
 - Hard to build (physical)

Getting Started With Python Using Anaconda

The screenshot shows a Jupyter Notebook interface running on localhost:8888. The title bar indicates it's an Untitled notebook using a Python 3 kernel, with a last checkpoint 2 minutes ago and unsaved changes. The menu bar includes File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. Below the menu is a toolbar with icons for file operations like Open, Save, and New, as well as Run, Cell, and Kernel controls. The main workspace displays two code cells:

```
In [2]: x=3
In [3]: print(x)
3
```

The cell In []: is currently active, indicated by a green border.

Run: Shift+Enter

DSP 2019, Arak University of Tech., Moein Ahmadi

Welcome to Python!

Python is a high-level programming language, with applications in numerous areas, including web programming, scripting, scientific computing, and artificial intelligence.

It is very popular and used by organizations such as Google, NASA, the CIA, and Disney.

The three major versions of Python are 1.x, 2.x and 3.x. These are subdivided into minor versions, such as 2.7 and 3.3.

Code written for Python 3.x is guaranteed to work in all future versions.

Both Python Version 2.x and 3.x are used currently.

This course covers **Python 3.x**, but it isn't hard to change from one version to another.

First Program

```
>>> print('Hello world!')  
Hello world!
```

Simple Operations

```
>>> 2 * (3 + 4)  
14  
>>> 10 / 2  
5.0
```

```
>>> -7  
-7  
>>> (-7 + 2) * (-4)  
20
```

```
>>> 11 / 0  
Traceback (most recent call last):  
File "<stdin>", line 1, in <module>  
ZeroDivisionError: division by zero
```

Floats

```
>>> 3/4  
0.75  
>>> 9.8765000  
9.8765
```

```
>>> 8 / 2  
4.0  
>>> 6 * 7.0  
42.0  
>>> 4 + 1.65  
5.65
```

Exponentiation

```
>>> 2**5  
32  
>>> 9 ** (1/2)  
3.0
```

Quotient & Remainder

```
>>> 20 // 6  
3  
>>> 1.25 % 0.5  
0.25
```

Strings

```
>>> "Python is fun!"  
'Python is fun!'  
>>> 'Always look on the bright side of life'  
'Always look on the bright side of life'
```

```
>>> 'Brian\'s mother: He\'s not the Messiah. He\'s a very naughty  
boy!'  
'Brian's mother: He's not the Messiah. He's a very naughty boy!'
```

```
>>> "Spam" + 'eggs'  
'Spameggs'
```

```
>>> print("spam" * 3)  
spamsplamsplams
```

```
>>> 4 * '2'  
'2222'
```

```
>>> "2" + "2"  
'22'  
>>> 1 + '2' + 3 + '4'  
Traceback (most recent call last):  
File "<stdin>", line 1, in <module>  
TypeError: unsupported operand type(s) for  
+: 'int' and 'str'
```

Input

```
>>> input("Enter something please: ")  
Enter something please: This is what\nthe user enters!  
  
'This is what\\nthe user enters!'
```

Type Conversion

```
>>> "2" + "3"  
'23'  
>>> int("2") + int("3")  
5  
  
>>> float(input("Enter a number: ")) + float(input("Enter  
another number: "))  
Enter a number: 40  
Enter another number: 2  
42.0
```

Variables

```
>>> x = 7  
>>> print(x)  
7  
>>> print(x + 3)  
10  
>>> print(x)  
7
```

```
>>> this_is_a_normal_name = 7  
  
>>> 123abc = 7  
SyntaxError: invalid syntax  
  
>>> spaces are not allowed  
SyntaxError: invalid syntax
```

```
>>> x = 123.456  
>>> print(x)  
123.456  
>>> x = "This is a string"  
>>> print(x + "!")  
This is a string!
```

```
>>> foo = "a string"  
>>> foo  
'a string'  
>>> bar  
NameError: name 'bar' is not defined  
>>> del foo  
>>> foo  
NameError: name 'foo' is not defined
```

Variables

```
>>> foo = input("Enter a number: ")  
Enter a number: 7  
>>> print(foo)  
7
```

In-Place Operators

```
>>> x = 2  
>>> print(x)  
2  
>>> x += 3  
>>> print(x)  
5
```

```
>>> x = "spam"  
>>> print(x)  
spam  
  
>>> x += "eggs"  
>>> print(x)  
spameggs
```

Comparisons: Booleans

```
>>> my_boolean = True
>>> my_boolean
True
```

```
>>> 2 == 3
False
>>> "hello" == "hello"
True
```

```
>>> 1 != 1
False
>>> "eleven" != "seven"
True
>>> 2 != 10
True
```

```
>>> 7 > 5
True
>>> 10 < 10
False
```

```
>>> 7 <= 8
True
>>> 9 >= 9.0
True
```

if Statements

```
if 10 > 5:  
    print("10 greater than 5")
```

```
num = 12  
if num > 5:  
    print("Bigger than 5")  
if num <=47:  
    print("Between 5 and 47")
```

```
x = 4  
if x == 5:  
    print("Yes")  
else:  
    print("No")
```

```
num = 7  
if num == 5:  
    print("Number is 5")  
else:  
    if num == 11:  
        print("Number is 11")  
    else:  
        if num == 7:  
            print("Number is 7")  
        else:  
            print("Number isn't 5, 11 or 7")
```

```
num = 7  
if num == 5:  
    print("Number is 5")  
elif num == 11:  
    print("Number is 11")  
elif num == 7:  
    print("Number is 7")  
else:  
    print("Number isn't 5, 11 or 7")
```

Boolean Logic

```
>>> 1 == 1 and 2 == 2
```

True

```
>>> 1 == 1 and 2 == 3
```

False

```
>>> 1 != 1 and 2 == 2
```

False

```
>>> 2 < 1 and 3 > 6
```

False

```
>>> not 1 == 1
```

False

```
>>> not 1 > 7
```

True

```
>>> 1 == 1 or 2 == 2
```

True

```
>>> 1 == 1 or 2 == 3
```

True

```
>>> 1 != 1 or 2 == 2
```

True

```
>>> 2 < 1 or 3 > 6
```

False

Operator Precedence

```
>>> False == False or True
True
>>> False == (False or True)
False
>>> (False == False) or True
True
```

Operator	Description
<code>**</code>	Exponentiation (raise to the power)
<code>~, +, -</code>	Complement, unary plus <u>and</u> minus (method names for the last two are <code>+@</code> and <code>-@</code>)
<code>*, /, %, //</code>	Multiply, divide, modulo and floor division
<code>+, -</code>	Addition and subtraction
<code>>>, <<</code>	Right and left bitwise shift
<code>&</code>	Bitwise 'AND'
<code>^</code>	Bitwise exclusive 'OR'
<code> </code>	Bitwise 'OR'
<code>in, not in, is, is not, <, <=, >, >=, !=, ==</code>	Comparison operators, equality operators, membership and identity operators
<code>not</code>	Boolean 'NOT'
<code>and</code>	Boolean 'AND'
<code>or</code>	Boolean 'OR'
<code>=, %=, /=, //=, -=, +=, *=, **=</code>	Assignment operators

while Loops

```
i = 1
while i <=5:
    print(i)
    i = i + 1

print("Finished!")

i = 0
while True:
    i = i +1
    if i == 2:

Class Review

Frequency Response
of LSI systems

$$y(n) = \sum_{k=-\infty}^{+\infty} h(k) x(n-k)$$

$$\text{Let } x(n) = e^{j\omega n}$$

$$y(n) = \sum_{k=-\infty}^{+\infty} h(k) \underbrace{e^{j\omega(n-k)}}_{(e^{j\omega n}) e^{-jk\omega}}$$

$$y(n) = e^{j\omega n} \underbrace{\sum_{k=-\infty}^{+\infty} h(k) e^{-jk\omega}}_{H(e^{j\omega})}$$

$$y(n) = H(e^{j\omega}) e^{j\omega n}$$

$$H(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} h(n) e^{-jn\omega}$$

\triangleq Frequency Response

Sinusoidal Response

$$\begin{aligned} x(n) &= A \cos(\omega_0 n + \phi) \\ &= \frac{A}{2} e^{j\phi} e^{j\omega_0 n} + \frac{A}{2} e^{-j\phi} e^{-j\omega_0 n} \end{aligned}$$

$$H(e^{j\omega_0}) = |H(e^{j\omega_0})| e^{j\theta(\omega_0)}$$

$$\begin{aligned} y(n) &= A |H(e^{j\omega_0})| \\ &\quad \cdot \cos(\omega_0 n + \phi + \theta) \end{aligned}$$

Class Review

Example

$$y(n) - ay(n-1) = x(n)$$

causal

$$h(n) = a^n u(n) \quad 0 < a < 1$$

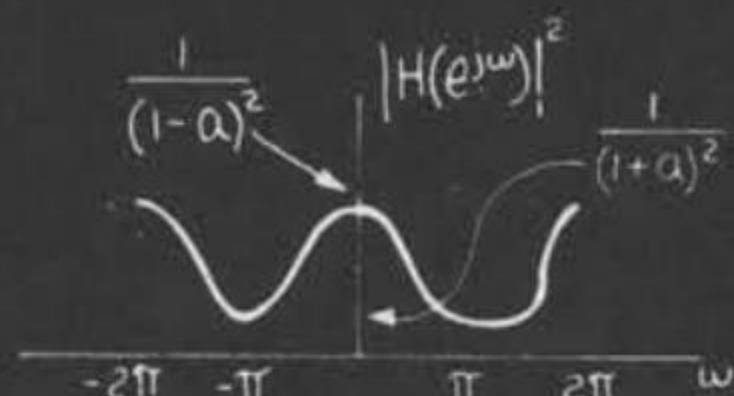

$$H(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} a^n u(n) e^{-jn\omega}$$

$$= \sum_{n=0}^{+\infty} (ae^{-j\omega})^n$$

$$= \frac{1}{1 - ae^{-j\omega}}$$

$$\begin{aligned} |H(e^{j\omega})|^2 &= \frac{1}{1 - ae^{j\omega}} \cdot \frac{1}{1 - ae^{-j\omega}} \\ &= \frac{1}{1 + a^2 - 2a \cos \omega} \end{aligned}$$

$$\therefore H(e^{j\omega}) = \tan^{-1} \left[\frac{-a \sin \omega}{1 - a \cos \omega} \right]$$

Properties of Freq Resp

1 Function of continuous variable $\underline{\omega}$

2 Periodic function of ω period 2π

$$\Rightarrow e^{j(\omega + 2\pi k)n} = e^{j\omega n} e^{j2\pi kn}$$

Generalization
The Fourier Transform

Class Review

Frequency Response

$$e^{j\omega n} \longrightarrow H(e^{j\omega}) e^{j\omega n}$$

$$H(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} h(n) e^{-j\omega n}$$

Properties.

1) fcn. of continuous variable ω

2) periodic - period 2π

$$H(e^{j\omega}) = H(e^{j(\omega + 2\pi k)})$$

$$h(n) = \frac{1}{2\pi} \int_{-\pi}^{\pi} \underbrace{H(e^{j\omega})}_{\text{Fourier Transform}} e^{j\omega n} d\omega$$

$$= \frac{1}{2\pi} \int_{-\pi}^{\pi} \left[\sum_k h(k) e^{-j\omega k} \right] e^{j\omega n} d\omega$$

$$= \frac{1}{2\pi} \sum_k h(k) \int_{-\pi}^{\pi} e^{j\omega(n-k)} d\omega$$

$n \neq k$	0
$n = k$	2π

$$= h(n)$$

Fourier Transform

$$X(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} x(n) e^{-j\omega n}$$

$$x(n) = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\omega}) e^{j\omega n} d\omega$$

$$= \lim_{\Delta\omega \rightarrow 0} \sum_k \left[X(e^{j\omega_k}) \frac{\Delta\omega}{2\pi} \right] e^{jk\omega_n}$$

Convolution Property

$$x(n) * h(n) \longleftrightarrow X(e^{j\omega}) H(e^{j\omega})$$

Class Review

$$X(e^{j\omega}) = \tilde{X}_A(j\Omega) |_{\Omega T = \omega}$$

$$= \frac{1}{T} \sum_{n=-\infty}^{+\infty} X_A(j\Omega + j\frac{2\pi n}{T})$$

Class Review

Class Review

$$X(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} x(n) e^{jn\omega}$$

$$\begin{aligned}|X(e^{j\omega})| &= \left| \sum_{-\infty}^{+\infty} x(n) e^{-jn\omega} \right| \\ &\leq \sum_{-\infty}^{+\infty} |x(n)| |e^{-jn\omega}| \end{aligned}$$

$X(e^{j\omega})$ converges if

$$\sum_{-\infty}^{+\infty} |x(n)| < \infty$$

stable system

$\curvearrowleft H(e^{j\omega})$ converges

Example

$$\textcircled{1} \quad x(n) = \left(\frac{1}{2}\right)^n u(n)$$

$$\sum_{-\infty}^{+\infty} |x(n)| = 2$$

$$\textcircled{2} \quad x(n) = (2)^n u(n)$$

$$\sum_{-\infty}^{+\infty} |x(n)| = \infty$$

$$X_r(e^{j\omega}) = \sum_{n=-\infty}^{+\infty} [x(n)r^{-n}] e^{-jn\omega}$$

$$= \sum_{-\infty}^{+\infty} x(n) \underbrace{(re^{j\omega})^n}_{z}$$

The z-Transform

$$z = re^{j\omega}$$

$$X(z) = \sum_{n=-\infty}^{+\infty} x(n) z^n$$

$$X(e^{j\omega}) = X(z) \Big|_{z=e^{j\omega}}$$

converges if

$$\sum_{n=-\infty}^{+\infty} |x(n) r^{-n}| < \infty$$

Class Review

Example

$$x(n) = (1/2)^n u(n)$$

$$X(z) = \sum_{n=0}^{\infty} (1/2)^n z^n = \sum_{n=0}^{\infty} (\frac{1}{2}z)^n$$

$$\frac{1}{2}z^n = \frac{z}{2}z^n$$

$$\therefore |(\frac{1}{2}z)^n| < \infty \Rightarrow |z| > \frac{1}{2}$$

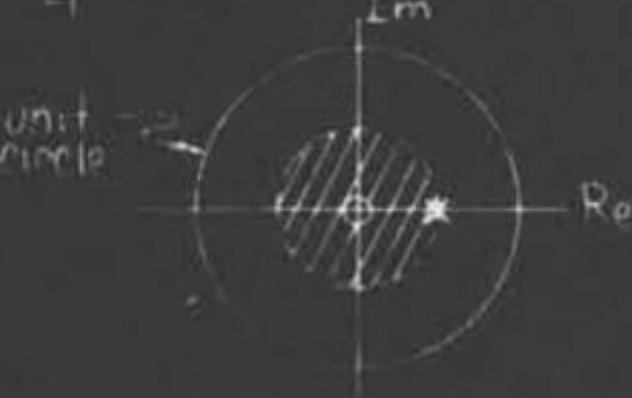

Example

$$y(n) = (1/2)^n u(n-1)$$

$$X(z) = \frac{1}{1 - \frac{1}{2}z^{-1}} = \frac{z}{z - \frac{1}{2}}$$

$$\sum_{n=1}^{\infty} \left| \left(\frac{1}{2}z^{-1} \right)^n \right| < \infty \Rightarrow |z| < \frac{1}{2}$$

(1) Region of Convergence
bounded by poles or (0/ ∞)

(2) Finite Length Sequences

$$0 < |z| < \infty$$

(3) Right-sided $x(n) = 0 \quad n < n_0$,
 $R_{x-} < |z| < \infty$

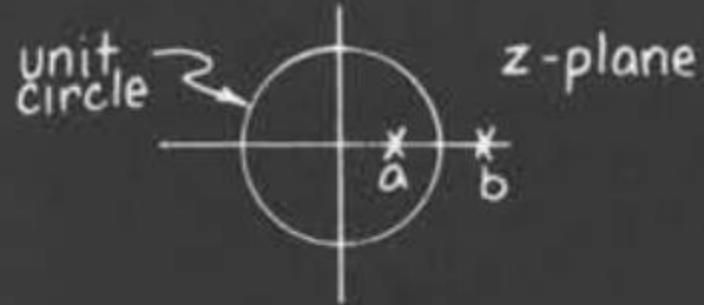

$$0 < |z| < R_{x+}$$

(4) Left-sided $x(n) = 0 \quad n > n_0$,

(5) Two-sided

$$R_{x-} < |z| < R_{x+}$$

Class Review

$$y(n) = \chi(n) * h(n)$$

$$\Upsilon(z) = \sum_{n=0}^{\infty} \chi(n) z^{-n}$$

$$H(z) = \frac{\Upsilon(z)}{Y(z)}$$

Example
 $y(n) - \frac{1}{2}y(n-1) = \chi(n)$
 useful property:

Region of Convergence which Fourier Sided Transform?

$|z| < a$ left no

$a < |z| < b$ two yes

$b < |z|$ right no

$H(z) \triangleq$ System Function

✓ Stable \leftrightarrow unit circle in R.of C.

causal $\implies h(n)$ right-sided
 \implies R.of C. outside outermost pole

$y(n) \leftrightarrow Y(z)$

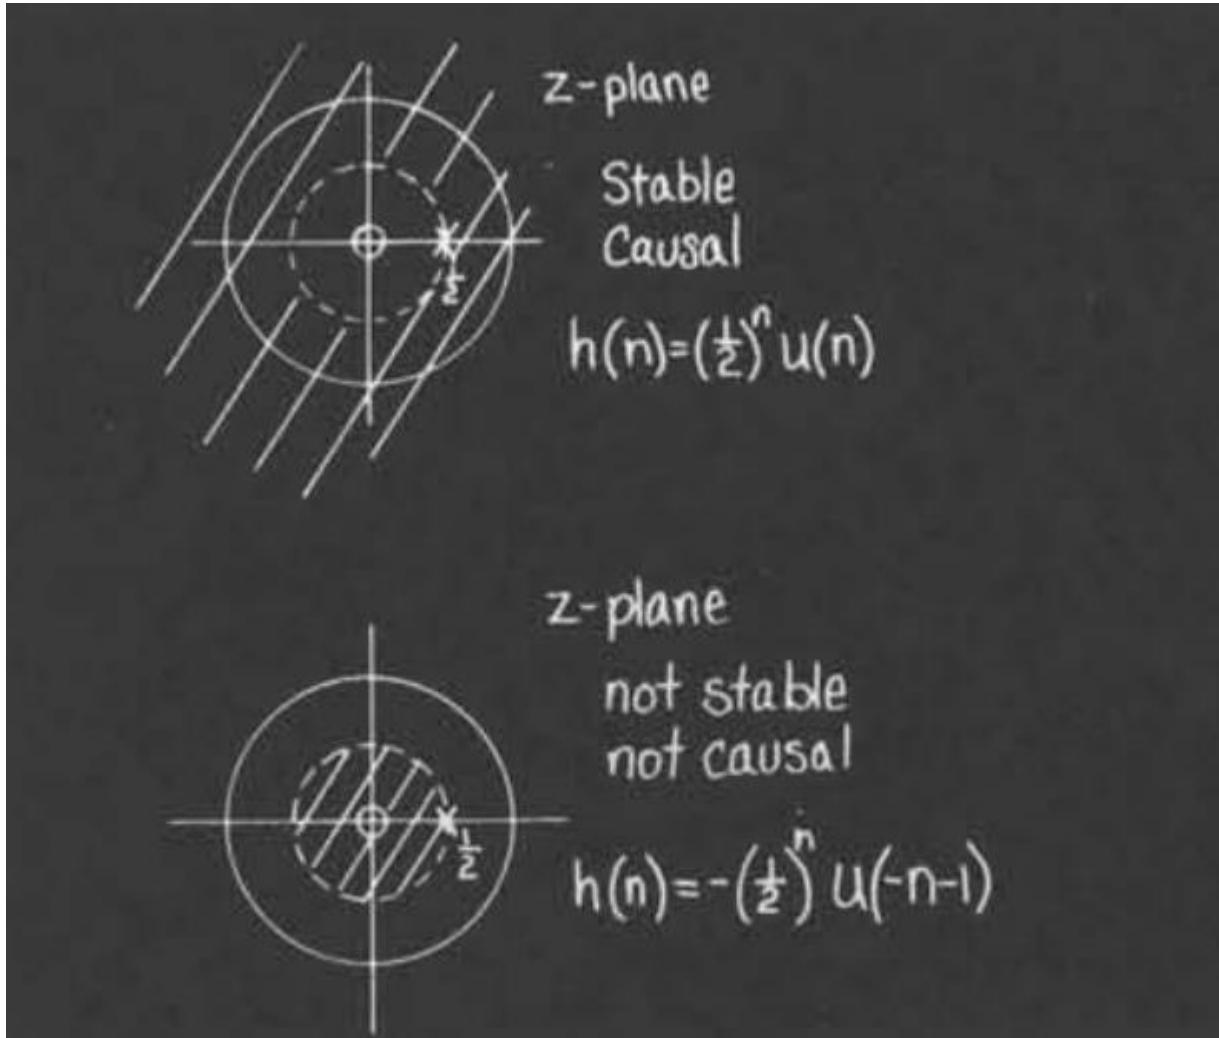

$y(n+n_0) \leftrightarrow z^{n_0} Y(z)$

$Y(z) - \frac{1}{2}z^{-1}Y(z) = \sum_{n=0}^{\infty} \chi(n) z^{-n}$

$$H(z) = \frac{Y(z)}{\sum_{n=0}^{\infty} \chi(n) z^{-n}}$$

$$= \frac{1}{1 - \frac{1}{2}z^{-1}}$$

Class Review

Class Review

$$X(z) = \sum_{n=-\infty}^{+\infty} x(n) z^{-n}$$

Inverse z-transform

Inspection Method

$$a^n u(n) \longleftrightarrow \frac{1}{1-a z^{-1}} \quad |z| > |a|$$

$$-a^n u(-n-1) \longleftrightarrow \frac{1}{1-a z^{-1}} \quad |z| < |a|$$

ETC.

2. Power Series

$$X(z) = \frac{1}{1-a z^{-1}} = \frac{z}{z-a}$$

$$|z| > |a|$$

$$\frac{1+a z^{-1}+a^2 z^{-2}+a^3 z^{-3}+\dots}{1-a z^{-1}}$$

$$\begin{aligned} &\frac{1-a z^{-1}}{a z^{-1}} \\ &\frac{a z^{-1}-a^2 z^{-2}}{a^2 z^{-2}} \end{aligned}$$

$$|z| < |a|$$

but also

$$\frac{1}{1-a z^{-1}} = -a^{-1} z - a^{-2} z^2 + \dots$$

3. Partial Fraction Exp.

$$F(x) = \frac{P(x)}{Q(x)} = \sum_{k=1}^N \frac{R_k}{x-x_k}$$

$$F(x)(x-x_r) \Big|_{(x=x_r)}$$

$$= \sum_{k=1}^N \underbrace{\frac{R_k}{(x-x_k)} (x-x_r)}_{\begin{cases} = 0 & k \neq r \\ = R_r & k = r \end{cases}} \Big|_{(x=x_r)}$$

$$R_r = F(x)(x-x_r) \Big|_{(x=x_r)}$$

= Residue of $F(z)$ at x_r

Class Review

$$X = z \quad \bar{X}(z) = \sum_k \frac{A_k}{z - a_k}$$

$$X = z^{-1} \quad \bar{X}(z) = \sum_k \frac{B_k}{1 - a_k z^{-1}}$$

Example

$$\bar{X}(z) = \frac{1}{(1 - \frac{1}{2}z^{-1})(1 - \frac{1}{4}z^{-1})} \quad |z| > \frac{1}{2}$$

Let $x \Rightarrow z^{-1}$

$$\frac{1}{(1 - \frac{1}{2}z^{-1})(1 - \frac{1}{4}z^{-1})} = \frac{8}{(z^{-1}-2)(z^{-1}-4)}$$

$$\frac{8}{(z^{-1}-2)(z^{-1}-4)} \Big|_{z^{-1}=2} = -4 \quad 4. \text{ Contour Integration}$$

$$X(n) = \frac{1}{2\pi j} \oint_c \bar{X}(z) z^{n-1} dz$$

$$\frac{8}{(z^{-1}-2)(z^{-1}-4)} \Big|_{z^{-1}=4} = 4$$

= \sum (residues of $\bar{X}(z) z^{n-1}$
at poles inside c)

$$\bar{X}(z) = \frac{-4}{z^{-1}-2} + \frac{4}{z^{-1}-4}$$

Example

$$= \underbrace{\frac{2}{1 - \frac{1}{2}z^{-1}}}_{z(\frac{1}{2})^n u(n)} + \underbrace{\frac{-1}{1 - \frac{1}{4}z^{-1}}}_{(\frac{1}{4})^n u(n)}$$

$$\bar{X}(z) = \frac{1}{1 - \frac{1}{2}z^{-1}}$$

$$= \frac{z}{z - \frac{1}{2}} \quad |z| > \frac{1}{2}$$

Class Review

$$\chi(n) = \frac{-1}{2\pi j} \oint_{C'} X(\gamma_p) p^{-n-1} dp$$

$n < 0$ 1 pole at $z = \frac{1}{2}$

n poles at $z = 0$

$$= \frac{1}{2\pi j} \oint_{C'} X(\gamma_p) p^{-n-1} dp$$

$$X(z) z^{n-1} = z^n / (z - \frac{1}{2})$$

Easy way:

$n \geq 0$ 1 pole at $z = \frac{1}{2}$

$$\chi(n) = \frac{1}{2\pi j} \oint_C X(z) z^{n-1} dz$$

Residue of $\frac{z^n}{z - \frac{1}{2}}$ at $z = \frac{1}{2}$

let $z = p^{-1}$ $z^{n-1} = p^{-n+1}$

$$\frac{z^n}{(z - \frac{1}{2})} \Big|_{z = \frac{1}{2}} = \left(\frac{1}{2}\right)^n$$

If $z = r e^{j\theta}$
then $p = (|r|) e^{-j\theta}$

Class Review

Previous Example

$$X(z) = \frac{1}{1 - \frac{1}{2}z^{-1}} \quad |z| > \frac{1}{2}$$

$$X(\frac{1}{p}) = \frac{1}{1 - \frac{1}{2}\frac{1}{p}} \quad |p| < 2$$

$$= \frac{-2}{p-2}$$

$$X(\frac{1}{p}) \propto p^{-n-1}$$

$n < 0$ 1 pole at $p=2$

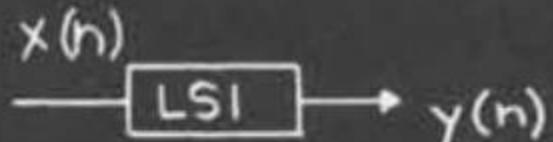

$$\therefore X(n) = 0 \quad n < 0$$

$n \geq 0$ 1 pole at $p=2$

$(n+1)$ poles at $p=0$

$$X(n) = (\frac{1}{2})^n \delta(n)$$

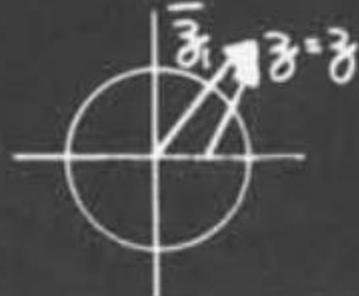

Class Review

$$\Sigma(\bar{z}) H(\bar{z}) = Y(\bar{z})$$

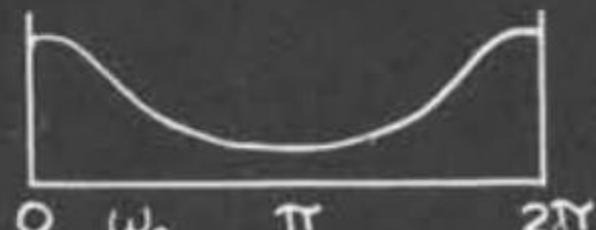

$$H(\bar{z}) \Big|_{\bar{z}=e^{j\omega}} = H(e^{j\omega})$$

$$H(\bar{z}) = \frac{1}{1 - a\bar{z}^{-1}} = \frac{\bar{z}}{\bar{z} - a}$$

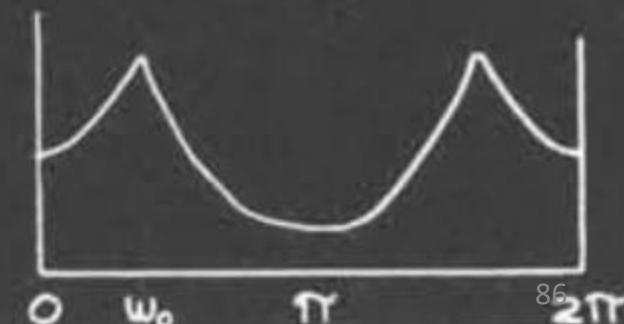

$$|H(\bar{z})| = |\bar{z}| / |(\bar{z} - a)|$$

$$\angle H(\bar{z}) = \angle \bar{z} - \angle (\bar{z} - a)$$

General
 $|H(e^{j\omega})| = \frac{\text{length zero}}{\text{length pole}}$

$$\angle H = \sum \angle \text{zero} - \sum \angle \text{pole}$$

Design Examples

Analog Butterworth filter

$$|H_a(j\omega)|^2 = \frac{1}{1 + (\frac{\omega}{\omega_c})^{2N}}$$

$$H_a(S)H_a(-S) = \frac{1}{1 + (\frac{S}{j\omega_c})^{2N}}$$

poles at

$$S_p = (-i)^{\frac{1}{2N}}(j\omega_c)$$

$$S_p = e^{j\left[\frac{\pi+2k\pi}{2N}\right]} e^{j\frac{\pi}{2}} \omega_c$$

Digital Filter Specs

$$(1-\delta_p) \geq -1 \text{ db}$$

$$\delta_s \leq -15 \text{ db}$$

$$20 \log_{10} |H(e^{j\omega})| \geq -1$$

$$\text{or } |H(e^{j2\pi})| \geq 10^{-0.5}$$

also

$$20 \log_{10} |H(e^{-j\omega})| \leq -15$$

$$\text{or } |H(e^{-j\omega})| \leq 10^{-0.5}$$

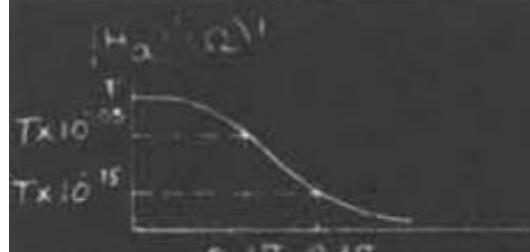

Impulse Invariant Design

$$h[n] = \sum_{k=-\infty}^{+\infty} h_a\left[\frac{n-k}{T} + j\frac{2\pi k}{T}\right]$$

$\Omega = \frac{\omega_c}{T}$

(reject Aliasing)

Class Review

$$|H_a(j\omega)|^2 = \frac{T^2}{1 + \left(\frac{\omega}{\Omega_c}\right)^{2N}}$$

$$1 + \left(\frac{\frac{\pi}{T}}{\Omega_c}\right)^{2N} = 10^{-1}$$

$$1 + \left(\frac{\frac{3\pi}{T}}{\Omega_c}\right)^{2N} = 10^{-5}$$

$$N = 5.8858 \quad N = 6$$

$$\Omega_c T = 70474$$

choose $N=6$

$$1 + \left(\frac{2\pi/T}{\Omega_c}\right)^{2 \times 6} = 10^{-1}$$

$$\Omega_c T = 7032$$

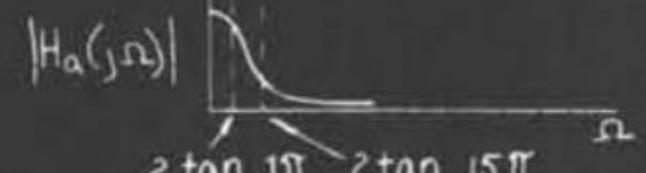

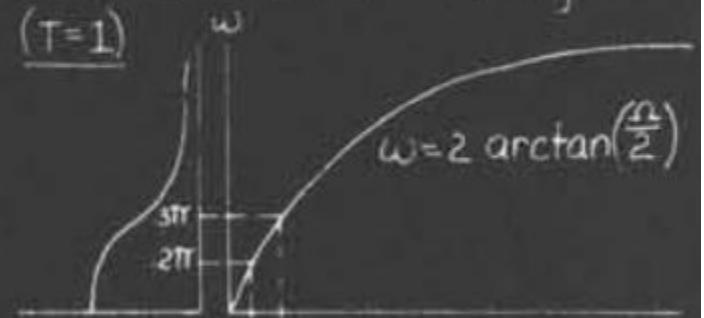

$$\underbrace{H_a(s) H_a(-s)}_{H_a(f)} = \frac{T^2}{1 + \left(\frac{2\pi}{7032}\right)^{2 \times 6}}$$

$$\frac{T=1}{h_a(f)} \longleftrightarrow H_a(s)$$

$$h_a(\frac{k}{T}) \longleftrightarrow T H_a(sT)$$

$$h(n) = h_a(nT) = h_a(n)$$

Bilinear Transform Design

$$20 \log_{10} |H_a(j2\tan 1\pi)| \geq -1$$

$$20 \log_{10} |H_a(j2\tan 1.5\pi)| \leq -15$$

Class Review

$$| + \left[\frac{j2\tan(0.1\pi)}{j\Omega_c} \right]^{2N} = 10^1 \quad ①$$

$$| + \left[\frac{j2\tan(0.15\pi)}{j\Omega_c} \right]^{2N} = 10^{1.5} \quad ②$$

$$\Rightarrow N = 5.30466$$

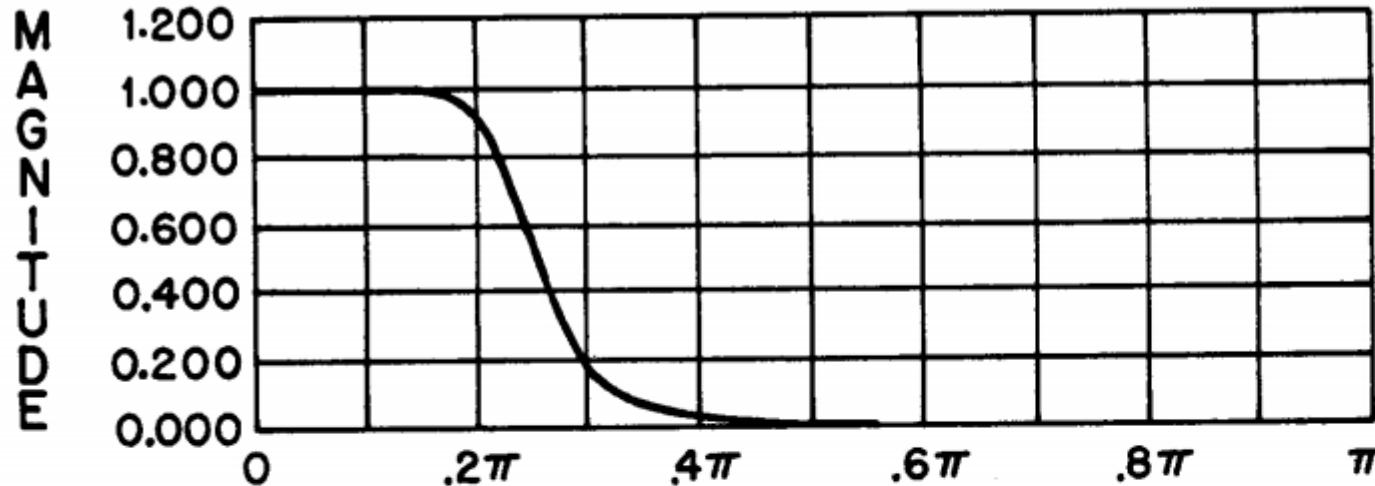

choose $N=6$ $\underbrace{H_a(s) H_a(s)}$

Meet stopband
exceed passband

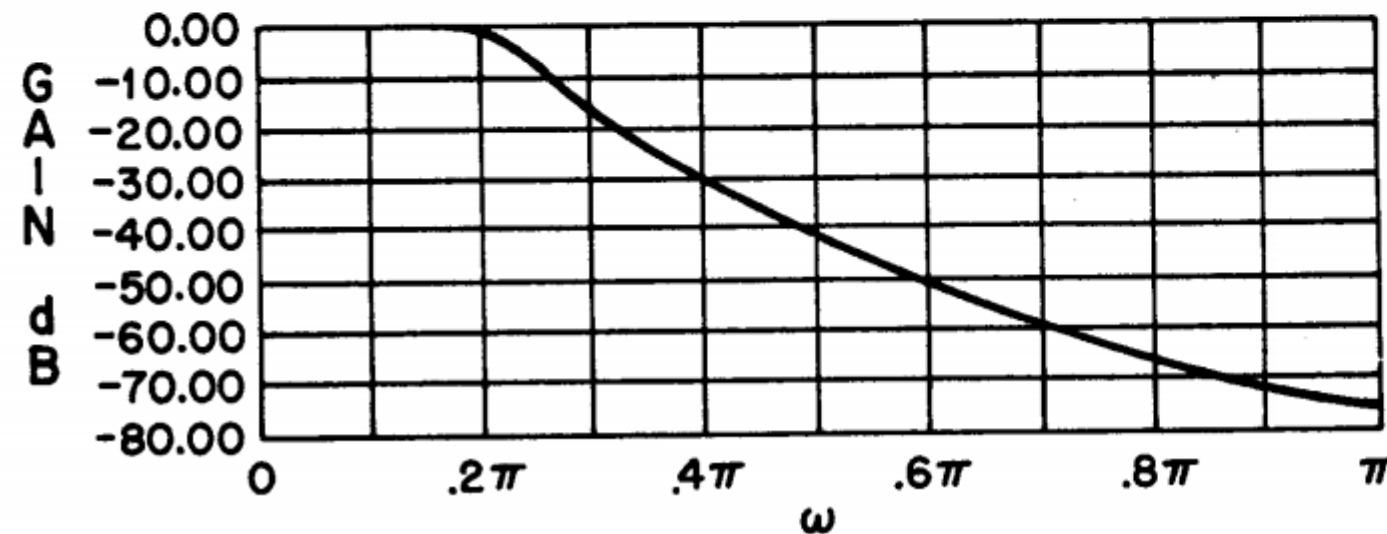

$$| + \left[\frac{j2\tan(0.15\pi)}{j\Omega_c} \right]^{2 \times 6} = 10^{1.5}$$

$$\Rightarrow \Omega_c = 7662.2$$

DESIGN OF FIR DIGITAL FILTERS

Basic design methods
for FIR digital
filters

$$H(z) = \sum_{n=0}^{N-1} h(n)z^{-n}$$

FOR LINEAR PHASE $h(n) = h(N-1-n)$

BASIC DESIGN METHODS:

- ① WINDOWS
- ② FREQUENCY SAMPLING
- ③ EQUIRIPPLE DESIGN

a.

DESIGN OF FIR FILTERS USING WINDOWS

Design of FIR filters
using the window
method.

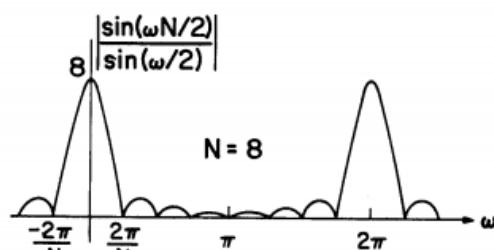

DESIRED UNIT SAMPLE RESPONSE: $h_d(n)$

$$h(n) = w(n)h_d(n)$$

$$w(n) = 0 \quad n < 0, \quad n > (N-1)$$

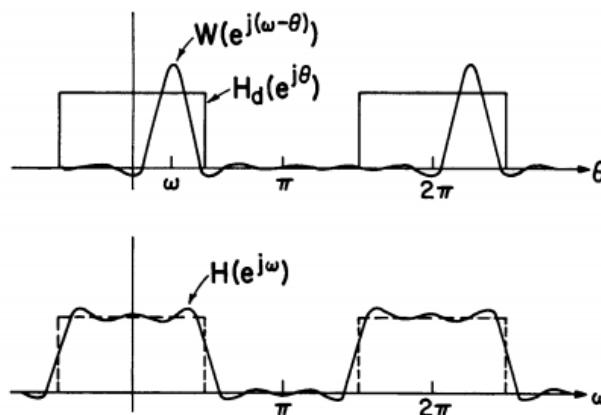

$$H(e^{j\omega}) = \frac{1}{2\pi} \int_{-\pi}^{\pi} H_d(e^{j\theta}) W[e^{j(\omega-\theta)}] d\theta$$

b.

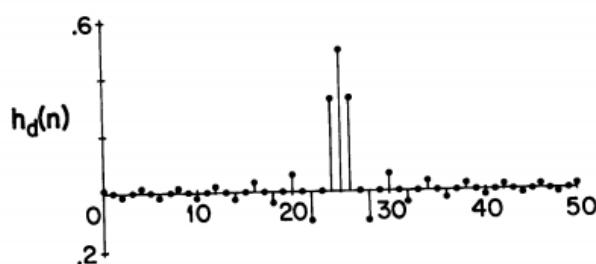

Magnitude of the
Fourier transform for
an eight point
rectangular window.

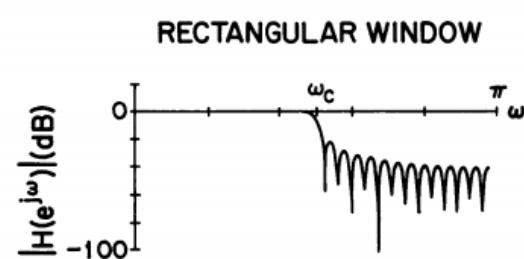

Class Review

Effect of convolving the Fourier transform of a rectangular window with an ideal low pass filter characteristic.

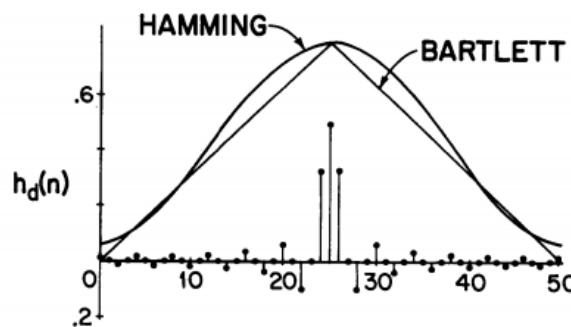

Unit-sample response of an ideal low-pass filter truncated by a 51-point rectangular window.

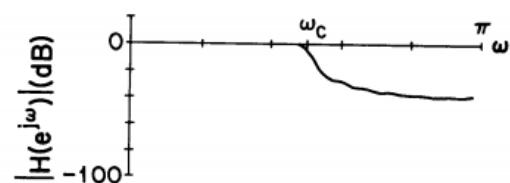

Frequency response corresponding to the unit-sample response in viewgraph e.

Class Review

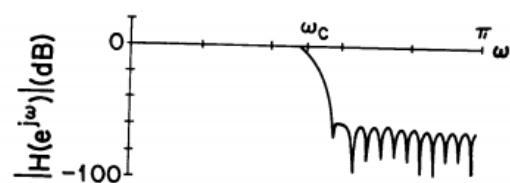

The Hamming and Bartlett windows.

BARTLETT WINDOW

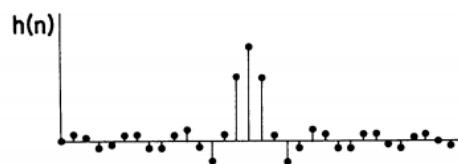

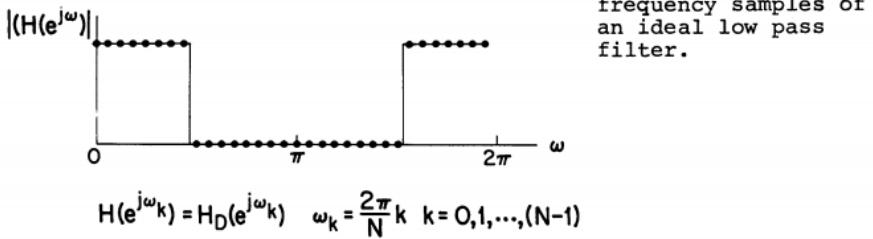

Frequency response of an FIR lowpass filter obtained by multiplying the unit-sample response of an ideal low pass filter by a Bartlett window.

HAMMING WINDOW

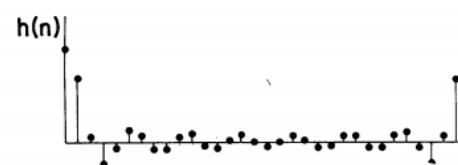

Frequency response of an FIR lowpass filter obtained by multiplying the unit sample response of an ideal lowpass filter by a Hamming window. (Note that the stopband attenuation is approximately 65 db not 30 db as stated in the lecture.)

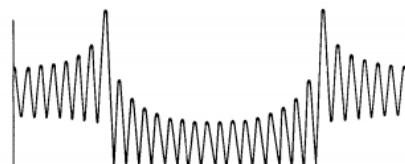

Class Review

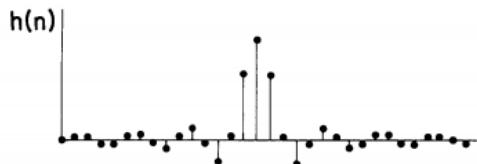

A unit-sample response whose DFT is equal to the frequency samples in viewgraph j.. The bottom trace is the magnitude of the Fourier transform of this unit-sample response.

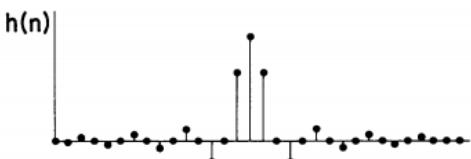

Another unit-sample response the magnitude of whose DFT is equal to the frequency samples in viewgraph j.. The bottom trace is the magnitude of the Fourier transform of this unit-sample response.

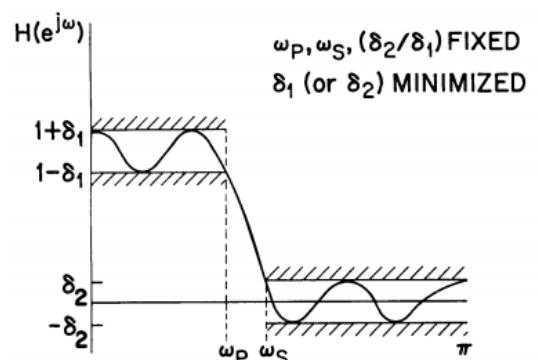

Class Review

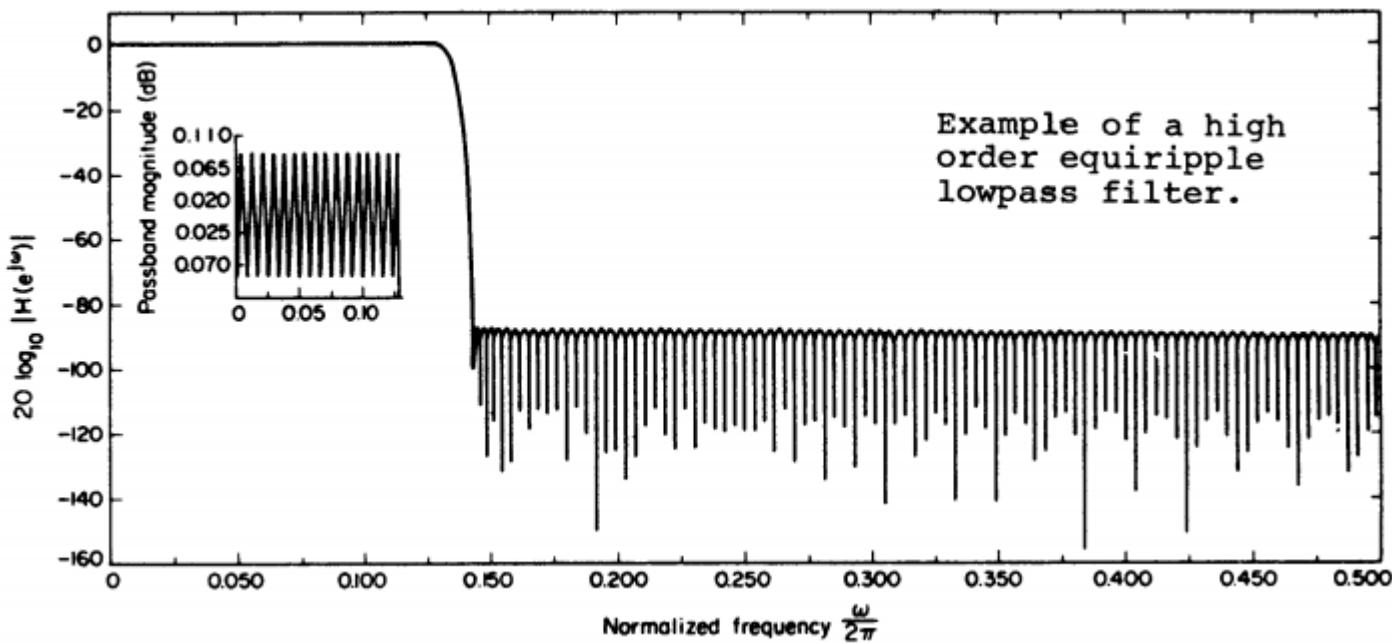

Unit sample response and frequency respons when one frequency sample is moved from the stopband into the transition band.

Similar to viewgraph m. with a different value of the frequenc sample in the transition band.

- Linear Programming (LP)
- (Convex) Quadratic Programming (QP)
- (Convex) Quadratically Constrained Quadratic Programming (QCQP)
- Second Order Cone Programming (SOCP)
- Semidefinite Programming (SDP)

Julia Programming Language for Optimization

1 Linear Programming

Definition 1. A linear program (*LP*) is the problem of optimizing a linear function over a polyhedron:

$$\begin{aligned} & \min c^T x \\ \text{s.t. } & a_i^T x \leq b_i, \quad i = 1, \dots, m, \end{aligned}$$

or written more compactly as

$$\begin{aligned} & \min c^T x \\ \text{s.t. } & Ax \leq b, \end{aligned}$$

for some $A \in \mathbb{R}^{m \times n}, b \in \mathbb{R}^m$.

Julia Programming Language for Optimization

2 Quadratic Programming

Definition 2. A quadratic program (QP) is an optimization problem with a quadratic objective and linear constraints

$$\begin{aligned} & \min_x x^T Qx + q^T x + c \\ & s.t. \quad Ax \leq b. \end{aligned}$$

Here, we have $Q \in S^{n \times n}$, $q \in \mathbb{R}^n$, $c \in \mathbb{R}$, $A \in \mathbb{R}^{m \times n}$, $b \in \mathbb{R}^m$.

Julia Programming Language for Optimization

3 Quadratically Constrained Quadratic Programming

Definition 3. A quadratically constrained quadratic program (QCQP) is an optimization problem with a quadratic objective and quadratic constraints:

$$\begin{aligned} & \min_x x^T Qx + q^T x + c \\ & \text{s.t. } x^T Q_i x + q_i^T x + c_i \leq 0, \quad i = 1, \dots, m. \end{aligned}$$

Here, we have $Q_i, Q \in S^{n \times n}$, $q, q_i \in \mathbb{R}^n$, $c, c_i \in \mathbb{R}^n$.

Julia Programming Language for Optimization

4 Second Order Cone Programming

Definition 4. A second order cone program (SOCP) is an optimization problem of the form:

$$\begin{aligned} \min_x f^T x \\ \|A_i x + b_i\|_2 \leq c_i^T x + d_i, \quad i = 1, \dots, m, \end{aligned} \tag{1}$$

where $A_i \in \mathbb{R}^{k_i \times n}$, $b_i \in \mathbb{R}^{k_i}$, $c_i \in \mathbb{R}^n$ and $d_i \in \mathbb{R}$.

The terminology of “SOCP” comes from its connection to the *second order cone* (also called the Lorentz cone or the ice-cream cone).

Julia Programming Language for Optimization

5 Semidefinite programming (SDP)

Semidefinite programming is the broadest class of convex optimization problems we consider in this class. As such, we will study this problem class in much more depth.

5.1 Definition and basic properties

5.1.1 Definition

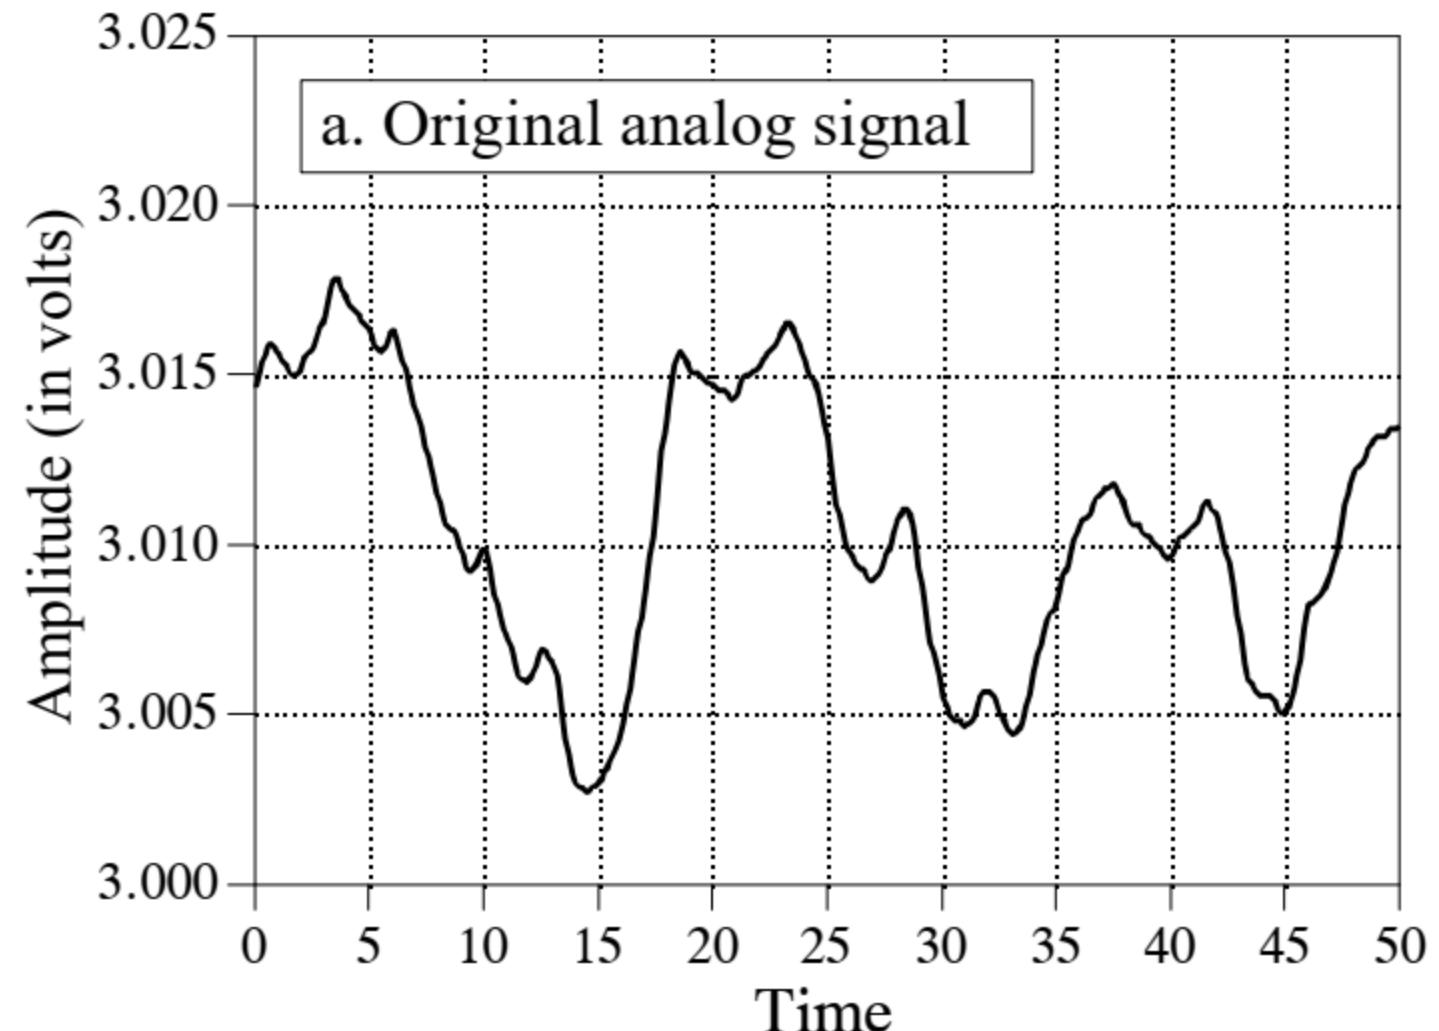

Definition 6. A semidefinite program is an optimization problem of the form

$$\begin{aligned} & \min_{X \in S^{n \times n}} \text{Tr}(CX) \\ & \text{s.t. } \text{Tr}(A_i X) = b_i, i = 1, \dots, m, \\ & \quad X \succeq 0, \end{aligned}$$

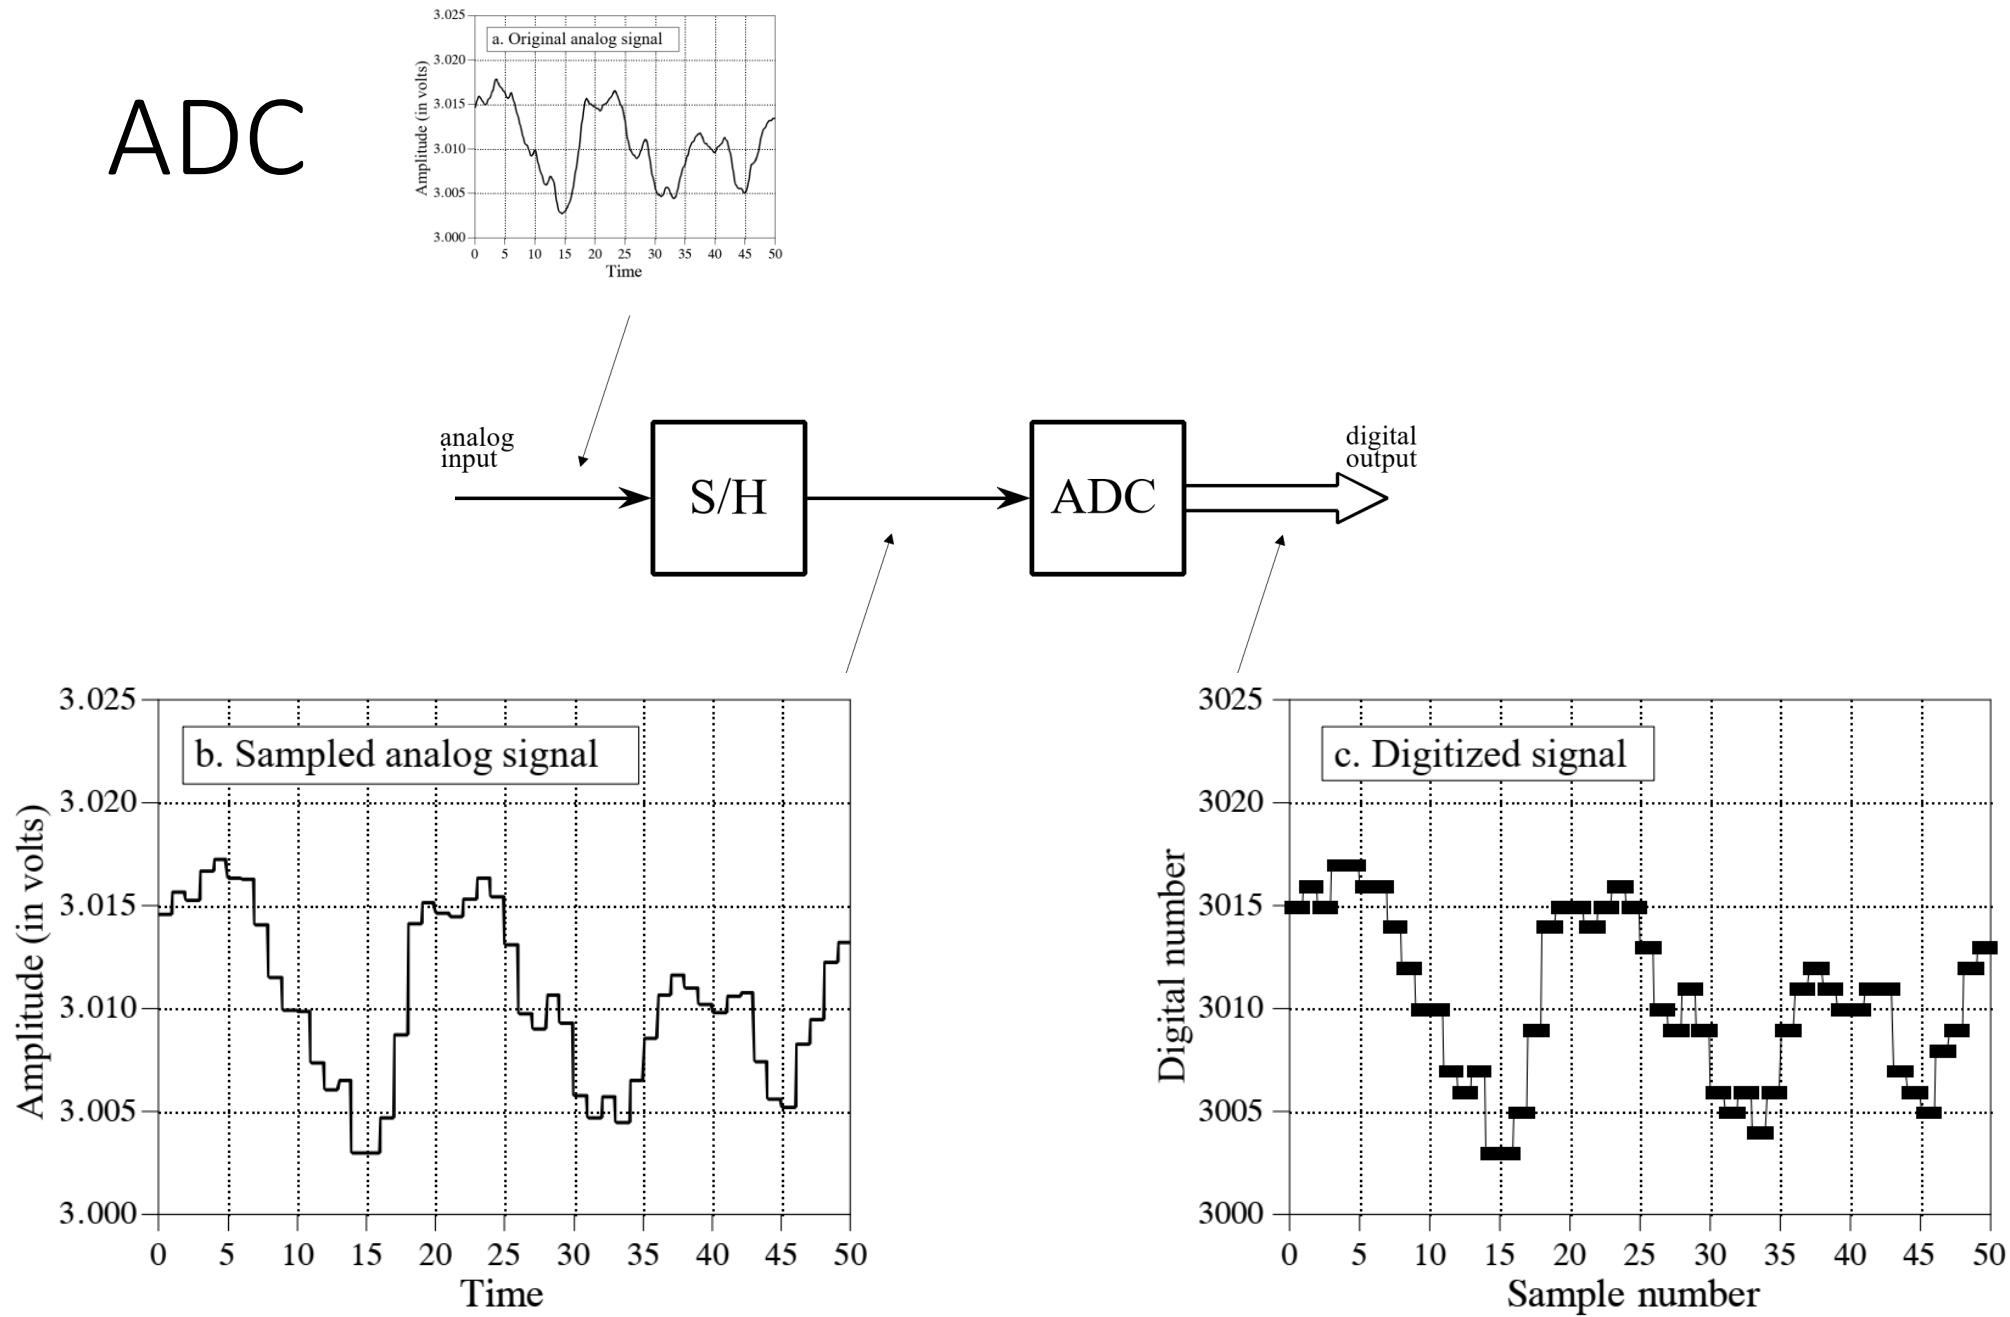

where the input data is $C \in S^{n \times n}$, $A_i \in S^{n \times n}$, $i = 1, \dots, m$, $b_i \in \mathbb{R}$, $i = 1, \dots, m$.

ADC in SUMMeR (Sub-Nyquist colocated MiMo Radar)

ADC

AD9684

**14-Bit, 500 MSPS LVDS,
Dual Analog-to-Digital Converter**

APPLICATIONS

Communications

Diversity multiband, multimode digital receivers

3G/4G, TD-SCDMA, W-CDMA, MC-GSM, LTE

General-purpose software radios

Ultrawideband satellite receiver

Instrumentation (spectrum analyzers, network analyzers,
integrated RF test solutions)

Radar

Digital oscilloscopes

High speed data acquisition systems

DOCSIS CMTS upstream receiver paths

HFC digital reverse path receivers

FEATURES

Parallel LVDS (DDR) outputs

1.1 W total power per channel at 500 MSPS

SFDR = 85 dBFS at 170 MHz f_{IN} (500 MSPS)

SNR = 68.6 dBFS at 170 MHz f_{IN} (500 MSPS)

ENOB = 10.9 bits at 170 MHz f_{IN}

DNL = ± 0.5 LSB

INL = ± 2.5 LSB

Noise density = -153 dBFS/Hz at 500 MSPS

1.25 V, 2.50 V, and 3.3 V supply operation

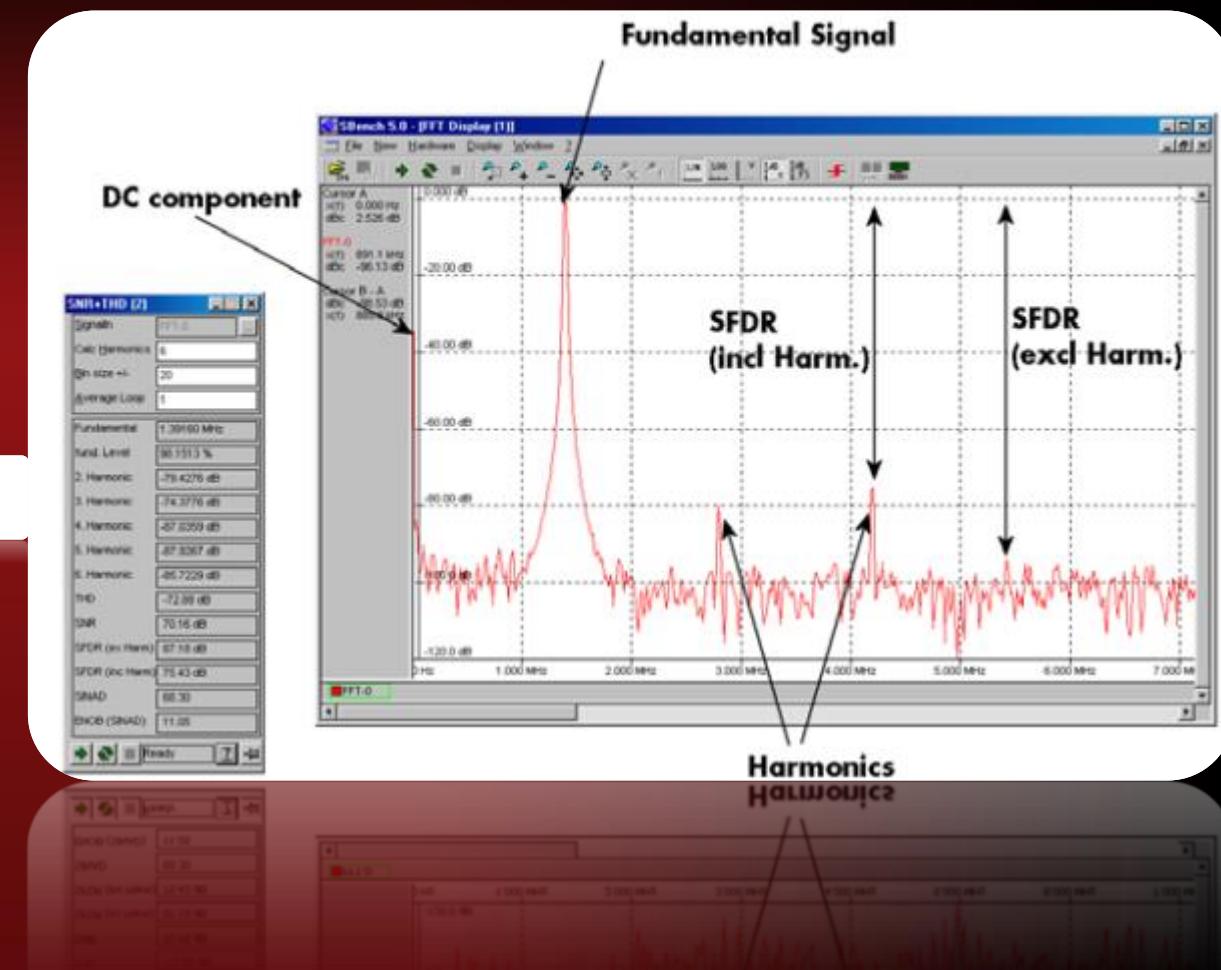

ADC

$$SNR = 20 * \log ([\text{Fundamental}] / \text{SQRT} (\text{SUM} (\text{SQR}([\text{Noise}])))$$

$$THD = 20 * \log (\text{SQRT} (\text{SUM} (\text{SQR} ([\text{Harmonics}]))) / [\text{Fundamental}])$$

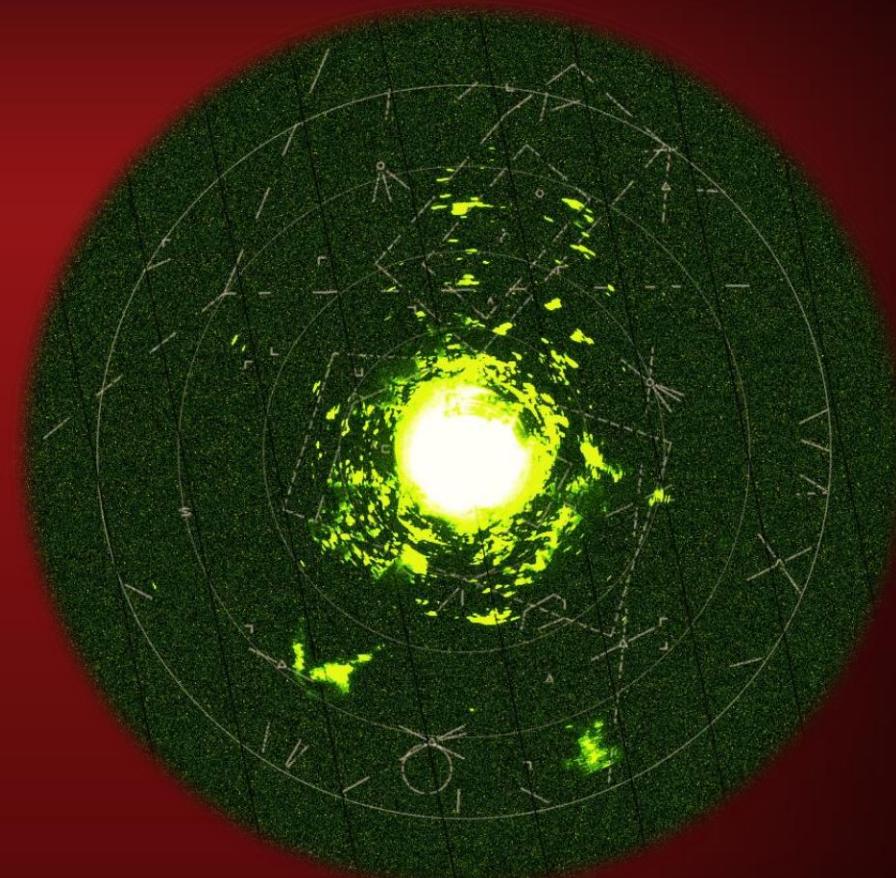

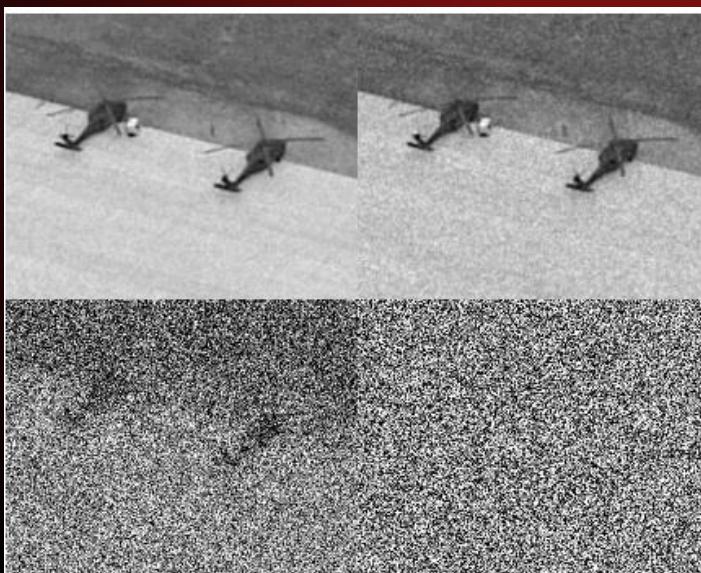

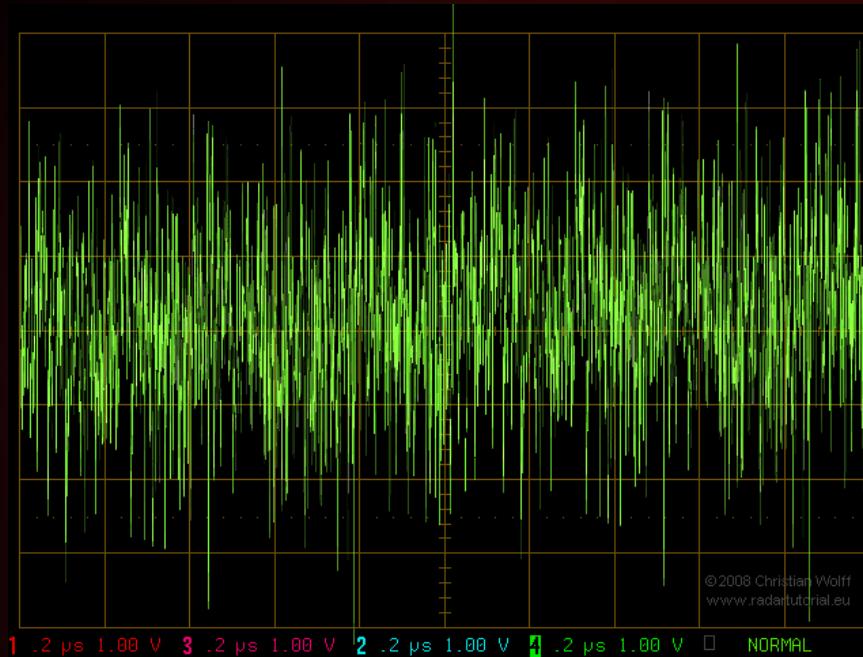

$$SINAD = 20 * \log ([\text{Fundamental}] / \text{SQRT} (\text{SUM} (\text{SQR}([\text{Noise + Harmonics}])))$$

$$ENOB = (SINAD - 1.76) / 6.02$$

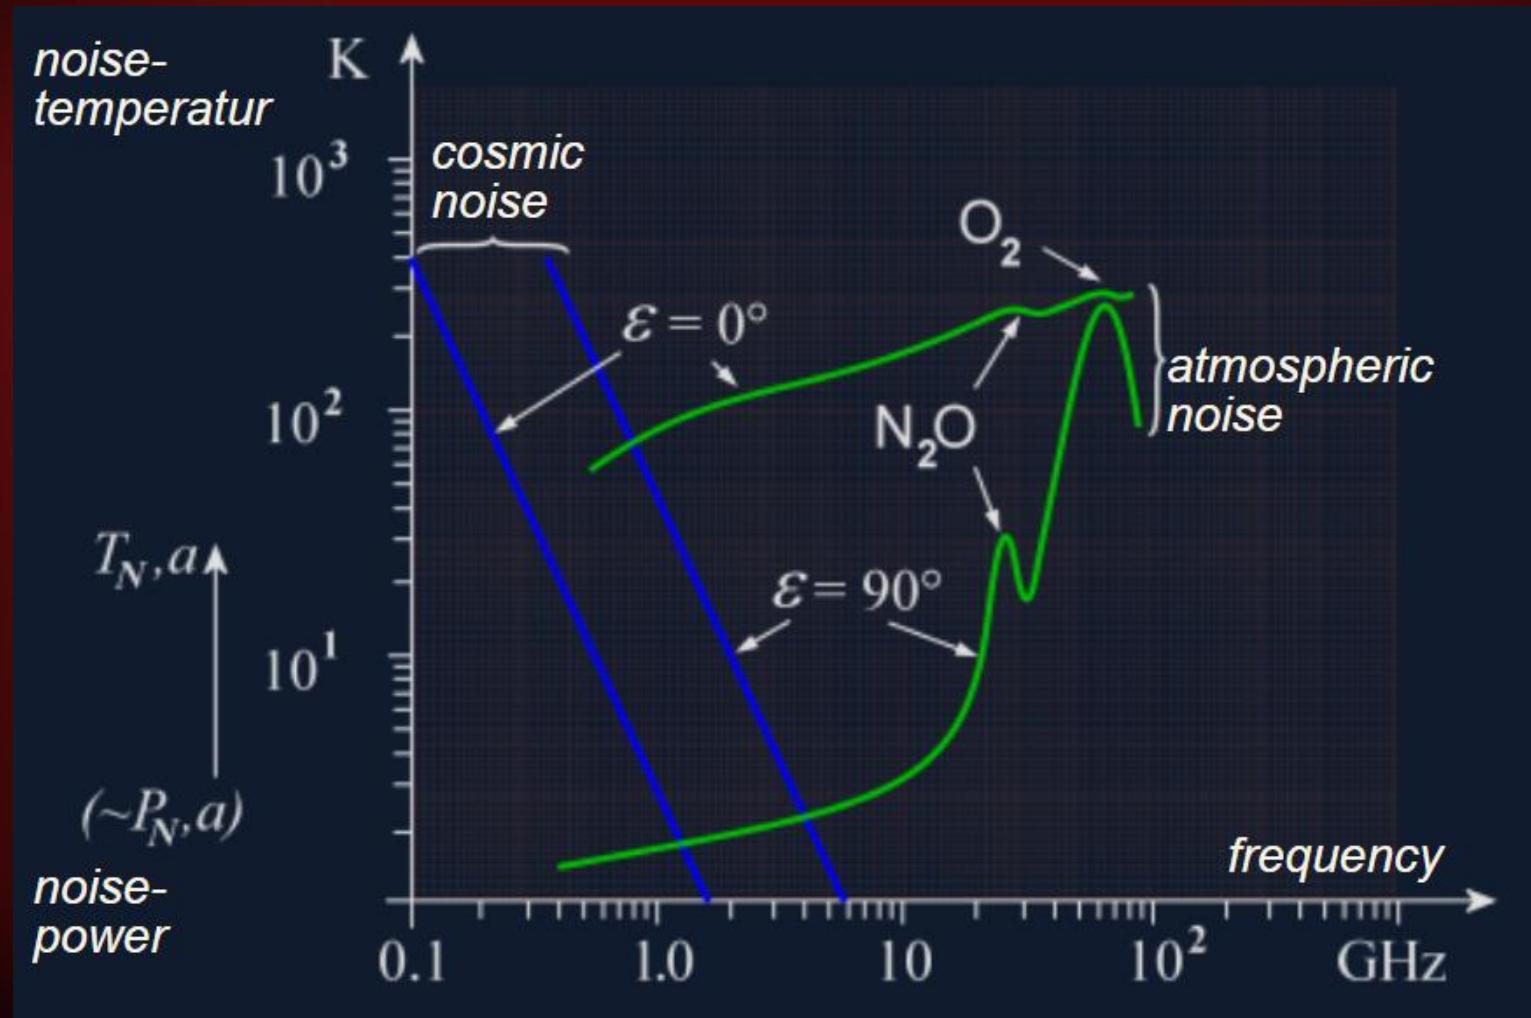

Noise

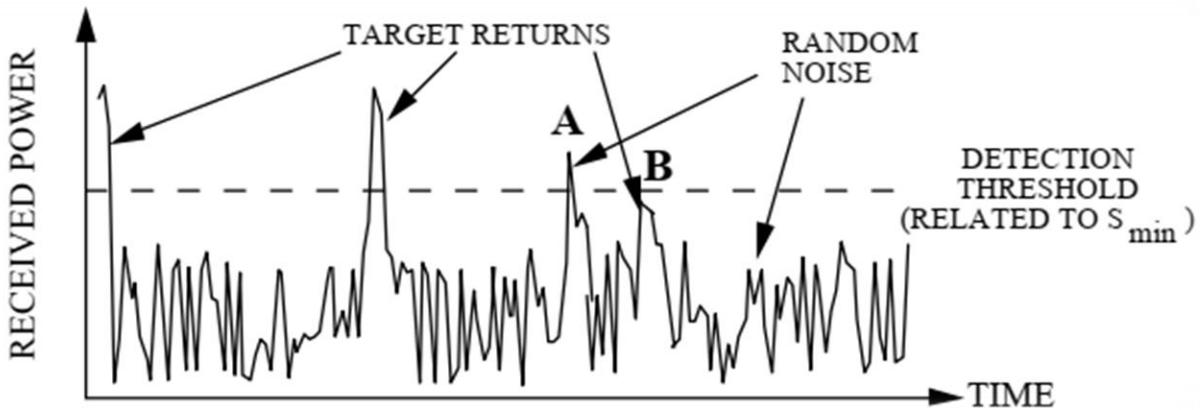

Noise

Noise

Thermal Noise

Consider a receiver at the standard temperature, T_o degrees Kelvin (K). Over a range of frequencies of bandwidth B_n (Hz) the available noise power is

$$N_o = kT_o B_n$$

where $k_B = 1.38 \times 10^{-23}$ (Joules/K) is Boltzman's constant.

$$\text{SNR} = \frac{P_r}{N_o} = \frac{P_t G_t G_r \sigma \lambda^2 G_p L}{(4\pi)^3 R^4 k_B T_s B_n}$$

Thermal Noise

$$N_o = kT_o B_n$$

```
K=1.38*1e-23
```

```
B = 1000 #Hz
```

```
T = 290
```

```
import math
N0 = K*T*B
N0dB = 10*math.log10(N0)
```

```
print("Noise Power for BW: 1 KHz = {0} dB = {1} dBm".format(N0dB,N0dB+30))
```

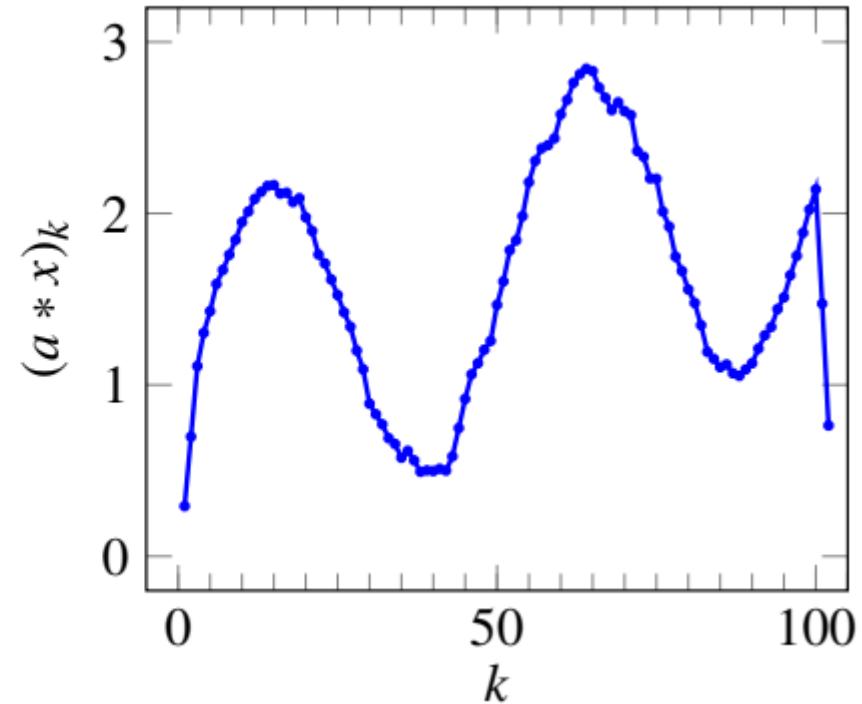

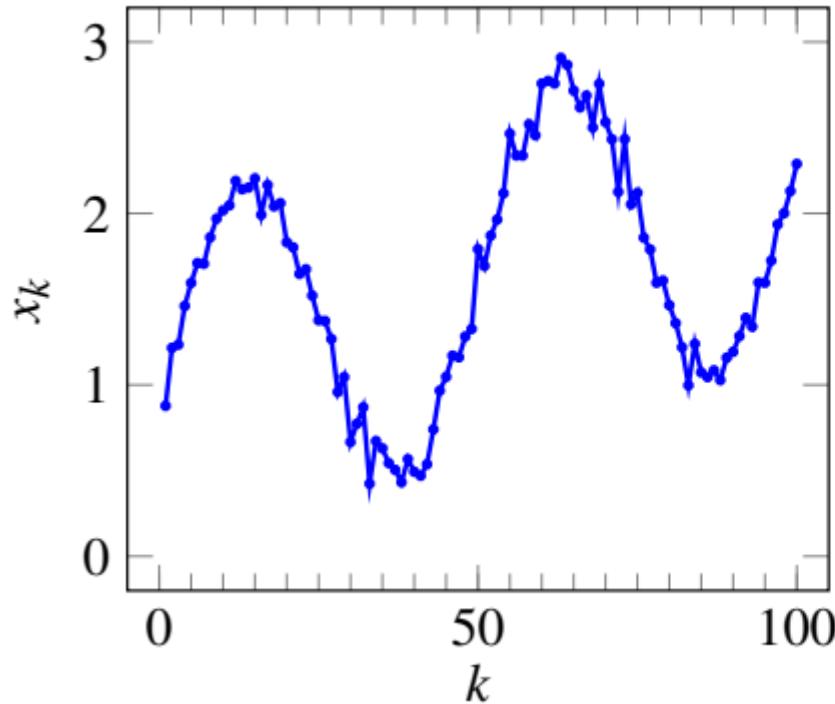

```
Noise Power for BW: 1 KHz = -173.97722915699808 dB = -143.97722915699808 dBm
```

System Noise

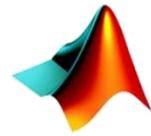

$$\text{Noise floor}_{\text{dBm}} = 10 \log_{10}(k \times T_0 \times 1000) + \text{NF} + 10 \log_{10} \text{BW}$$

Moving Average Filter

$$y_k = \frac{1}{3}(x_k + x_{k-1} + x_{k-2}), \quad k = 1, 2, \dots, n+2$$

TCP Connection in Python and C++

```
import socket
TCP_IP = '127.0.0.1'
TCP_PORT = 5462
BUFFER_SIZE = 1024
MESSAGE = "Hello, World!"
s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
s.connect((TCP_IP, TCP_PORT))
s.send(MESSAGE.encode('utf-8'))
data = s.recv(BUFFER_SIZE)
s.close()
print("received data:", data)

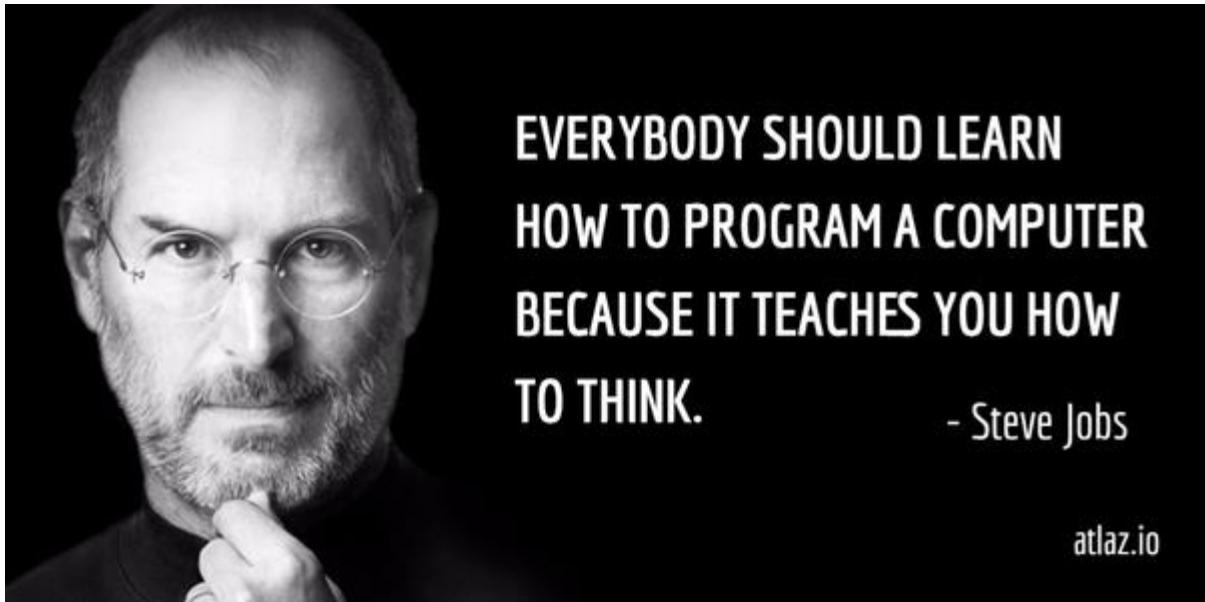

received data: b'Moein'
```

MainWindow

The application window has a title bar 'MainWindow'. Inside, there is a text area displaying the text 'Hello, World!'. Below it is a text input field containing the text 'Moein'. To the right of the input field is a button labeled 'Send Data'. The window has standard minimize, maximize, and close buttons at the top right.

Comments

C++

C++ is a general-purpose programming language.

C++ is used to create computer programs. Anything from art applications, music players and even video games!

```
#include <iostream>
using namespace std;

int main()
{
    cout << "Hello world!";
    return 0;
}
```

```
int myVariable = 10;

int mark = 90;

if (mark < 50) {
    cout << "You failed." << endl;
}
else {
    cout << "You passed." << endl;
}
```

C++

Qt

```

> main.cpp
1 #include "mainwindow.h"
2 #include <QApplication>
3
4 int main(int argc, char *argv[])
5 {
6     QApplication a(argc, argv);
7     MainWindow w;
8     w.show();
9
10    return a.exec();
11}
12

```

```

> mainwindow.cpp
1 #include "mainwindow.h"
2 #include "ui_mainwindow.h"
3
4 MainWindow::MainWindow(QWidget *parent) :
5     QMainWindow(parent),
6     ui(new Ui::MainWindow)

Python for DSP

Numpy

Basic data types:

Numbers, Booleans, Strings

Numbers: Integers and floats work as you would expect from other languages:

```
x = 3
print(type(x)) # Prints "<class 'int'>"
print(x)       # Prints "3"
print(x + 1)   # Addition; prints "4"
print(x - 1)   # Subtraction; prints "2"
print(x * 2)   # Multiplication; prints "6"
print(x ** 2)  # Exponentiation; prints "9"
x += 1
print(x)       # Prints "4"
x *= 2
print(x)       # Prints "8"
y = 2.5
print(type(y)) # Prints "<class 'float'>"
print(y, y + 1, y * 2, y ** 2) # Prints "2.5 3.5 5.0 6.25"
```

Booleans: Python implements all of the usual operators for Boolean logic, but uses English words rather than symbols (&&, ||, etc.):

```
t = True
f = False
print(type(t)) # Prints "<class 'bool'>"
print(t and f) # Logical AND; prints "False"
print(t or f)  # Logical OR; prints "True"
print(not t)   # Logical NOT; prints "False"
print(t != f)  # Logical XOR; prints "True"
```

Basic data types:

Numbers, Booleans, Strings

Strings: Python has great support for strings:

```
hello = 'hello'      # String literals can use single quotes
world = "world"      # or double quotes; it does not matter.
print(hello)         # Prints "hello"
print(len(hello))   # String length; prints "5"
hw = hello + ' ' + world # String concatenation
print(hw) # prints "hello world"
hw12 = '%s %s %d' % (hello, world, 12) # sprintf style string formatting
print(hw12) # prints "hello world 12"
```

```
s = "hello"
print(s.capitalize()) # Capitalize a string; prints "Hello"
print(s.upper())     # Convert a string to uppercase; prints "HELLO"
print(s.rjust(7))    # Right-justify a string, padding with spaces; prints " hello"
print(s.center(7))   # Center a string, padding with spaces; prints " hello "
print(s.replace('l', '(ell)')) # Replace all instances of one substring with another;
                             # prints "he(ell)(ell)o"
print(' world '.strip()) # Strip leading and trailing whitespace; prints "world"
```

Containers: List, Dictionary, Set, Tuple

List

```
xs = [3, 1, 2]      # Create a list
print(xs, xs[2])    # Prints "[3, 1, 2] 2"
print(xs[-1])       # Negative indices count from the end of the list; prints "2"
xs[2] = 'foo'        # Lists can contain elements of different types
print(xs)            # Prints "[3, 1, 'foo']"
xs.append('bar')     # Add a new element to the end of the list
print(xs)            # Prints "[3, 1, 'foo', 'bar']"
x = xs.pop()         # Remove and return the last element of the list
print(x, xs)         # Prints "bar [3, 1, 'foo']"
```

```
nums = list(range(5))      # range is a built-in function that creates a list of integers
print(nums)                 # Prints "[0, 1, 2, 3, 4]"
print(nums[2:4])            # Get a slice from index 2 to 4 (exclusive); prints "[2, 3]"
print(nums[2:])              # Get a slice from index 2 to the end; prints "[2, 3, 4]"
print(nums[:2])              # Get a slice from the start to index 2 (exclusive); prints "[0, 1]"
print(nums[:])                # Get a slice of the whole list; prints "[0, 1, 2, 3, 4]"
print(nums[::-1])            # Slice indices can be negative; prints "[0, 1, 2, 3]"
nums[2:4] = [8, 9]           # Assign a new sublist to a slice
print(nums)                 # Prints "[0, 1, 8, 9, 4]"
```

Containers: List, Dictionary, Set, Tuple

List

```
animals = ['cat', 'dog', 'monkey']
for animal in animals:
    print(animal)
# Prints "cat", "dog", "monkey", each on its own line.
```

```
animals = ['cat', 'dog', 'monkey']
for idx, animal in enumerate(animals):
    print('#%d: %s' % (idx + 1, animal))
# Prints "#1: cat", "#2: dog", "#3: monkey", each on its own line
```

```
nums = [0, 1, 2, 3, 4]

print(even_squares) # Prints "[0, 4, 16]"
```

Containers: List, Dictionary, Set, Tuple

Dictionary

```
d = {'cat': 'cute', 'dog': 'furry'} # Create a new dictionary with some data
print(d['cat'])                  # Get an entry from a dictionary; prints "cute"
print('cat' in d)                # Check if a dictionary has a given key; prints "True"
d['fish'] = 'wet'                 # Set an entry in a dictionary
print(d['fish'])                  # Prints "wet"
# print(d['monkey']) # KeyError: 'monkey' not a key of d
print(d.get('monkey', 'N/A'))    # Get an element with a default; prints "N/A"
print(d.get('fish', 'N/A'))       # Get an element with a default; prints "wet"
del d['fish']                    # Remove an element from a dictionary
print(d.get('fish', 'N/A')) # "fish" is no longer a key; prints "N/A"
```

```
d = {'person': 2, 'cat': 4, 'spider': 8}
for animal in d:
    legs = d[animal]
    print('A %s has %d legs' % (animal, legs))
# Prints "A person has 2 legs", "A cat has 4 legs", "A spider has 8 legs"
```

```
d = {'person': 2, 'cat': 4, 'spider': 8}
for animal, legs in d.items():
    print('A %s has %d legs' % (animal, legs))
# Prints "A person has 2 legs", "A cat has 4 legs", "A spider has 8 legs"
```

```
nums = [0, 1, 2, 3, 4]
even_num_to_square = {x: x ** 2 for x in nums if x % 2 == 0}
print(even_num_to_square) # Prints "{0: 0, 2: 4, 4: 16}"
```

Containers: List, Dictionary, Set, Tuple

Set

```
animals = {'cat', 'dog'}
print('cat' in animals)    # Check if an element is in a set; prints "True"
print('fish' in animals)   # prints "False"
animals.add('fish')        # Add an element to a set
print('fish' in animals)   # Prints "True"
print(len(animals))        # Number of elements in a set; prints "3"
animals.add('cat')         # Adding an element that is already in the set does nothing
print(len(animals))        # Prints "3"
animals.remove('cat')      # Remove an element from a set
print(len(animals))        # Prints "2"

animals = {'cat', 'dog', 'fish'}
for idx, animal in enumerate(animals):
    print('#%d: %s' % (idx + 1, animal))
# Prints "#1: fish", "#2: dog", "#3: cat"

from math import sqrt
nums = {int(sqrt(x)) for x in range(30)}
print(nums)  # Prints "{0, 1, 2, 3, 4, 5}"
```

Containers: List, Dictionary, Set, Tuple

Tuple

tuple is in many ways similar to a list; one of the most important differences is that tuples can be used as keys in dictionaries and as elements of sets, while lists cannot.

```
d = {(x, x + 1): x for x in range(10)} # Create a dictionary with tuple keys
t = (5, 6)          # Create a tuple
print(type(t))      # Prints "<class 'tuple'>"
print(d[t])         # Prints "5"
print(d[(1, 2)])    # Prints "1"
```

Functions

```
def sign(x):
    if x > 0:
        return 'positive'
    elif x < 0:
        return 'negative'
    else:
        return 'zero'

for x in [-1, 0, 1]:
    print(sign(x))
# Prints "negative", "zero", "positive"
```

```
def hello(name, loud=False):
    if loud:
        print('HELLO, %s!' % name.upper())
    else:
        print('Hello, %s' % name)

hello('Bob') # Prints "Hello, Bob"
hello('Fred', loud=True) # Prints "HELLO, FRED!"
```

Classes

```
class Greeter(object):

    # Constructor
    def __init__(self, name):
        self.name = name # Create an instance variable

    # Instance method
    def greet(self, loud=False):
        if loud:
            print('HELLO, %s!' % self.name.upper())
        else:
            print('Hello, %s' % self.name)

g = Greeter('Fred') # Construct an instance of the Greeter class
g.greet()           # Call an instance method; prints "Hello, Fred"
g.greet(loud=True)  # Call an instance method; prints "HELLO, FRED!"
```

libraries Numpy SciPy Matplotlib

Numpy Arrays

```
import numpy as np

a = np.array([1, 2, 3])      # Create a rank 1 array
print(type(a))              # Prints <class 'numpy.ndarray'>
print(a.shape)               # Prints (3,)
print(a[0], a[1], a[2])     # Prints "1 2 3"
a[0] = 5                    # Change an element of the array
print(a)                     # Prints "[5, 2, 3]"

b = np.array([[1,2,3],[4,5,6]])    # Create a rank 2 array
print(b.shape)                # Prints "(2, 3)"
print(b[0, 0], b[0, 1], b[1, 0])  # Prints "1 2 4"
```

```
import numpy as np

a = np.zeros((2,2))          # Create an array of all zeros
print(a)                      # Prints "[[ 0.  0.]
                             #           [ 0.  0.]]"

b = np.ones((1,2))           # Create an array of all ones
print(b)                      # Prints "[[ 1.  1.]]"

c = np.full((2,2), 7)        # Create a constant array
print(c)                      # Prints "[[ 7.  7.]
                             #           [ 7.  7.]]"

d = np.eye(2)                 # Create a 2x2 identity matrix
print(d)                      # Prints "[[ 1.  0.]
                             #           [ 0.  1.]]"

e = np.random.random((2,2))   # Create an array filled with random values
print(e)                      # Might print "[[ 0.91940167  0.08143941]
                             #           [ 0.68744134  0.87236687]]"
```

libraries Numpy SciPy Matplotlib

Numpy Array indexing

```
import numpy as np

# Create the following rank 2 array with shape (3, 4)
# [[ 1  2  3  4]
# [ 5  6  7  8]
# [ 9 10 11 12]]
a = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])

# Use slicing to pull out the subarray consisting of the first 2 rows
# and columns 1 and 2; b is the following array of shape (2, 2):
# [[2 3]
# [6 7]]
b = a[:2, 1:3]

# A slice of an array is a view into the same data, so modifying it
# will modify the original array.
print(a[0, 1])    # Prints "2"
b[0, 0] = 77      # b[0, 0] is the same piece of data as a[0, 1]
print(a[0, 1])    # Prints "77"
```

```
import numpy as np

# Create the following rank 2 array with shape (3, 4)
# [[ 1  2  3  4]
# [ 5  6  7  8]
# [ 9 10 11 12]]
a = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])

# Two ways of accessing the data in the middle row of the array.
# Mixing integer indexing with slices yields an array of lower rank,
# while using only slices yields an array of the same rank as the
# original array:
row_r1 = a[1, :]    # Rank 1 view of the second row of a
row_r2 = a[1:2, :]  # Rank 2 view of the second row of a
print(row_r1, row_r1.shape) # Prints "[5 6 7 8] (4,)"
print(row_r2, row_r2.shape) # Prints "[[5 6 7 8]] (1, 4)"

# We can make the same distinction when accessing columns of an array:
col_r1 = a[:, 1]
col_r2 = a[:, 1:2]
print(col_r1, col_r1.shape) # Prints "[ 2  6 10] (3,)"
print(col_r2, col_r2.shape) # Prints "[[ 2
                            #       [ 6
                            #       [10]] (3, 1)"
```

libraries Numpy SciPy Matplotlib

Numpy Array indexing

```
import numpy as np

a = np.array([[1,2], [3, 4], [5, 6]])

# An example of integer array indexing.
# The returned array will have shape (3,) and
print(a[[0, 1, 2], [0, 1, 0]]) # Prints "[1 4 5]

# The above example of integer array indexing is equivalent to this:
print(np.array([a[0, 0], a[1, 1], a[2, 0]])) # Prints "[1 4 5]

# When using integer array indexing, you can reuse the same
# element from the source array:
print(a[[0, 0], [1, 1]]) # Prints "[2 2]

# Equivalent to the previous integer array indexing example
print(np.array([a[0, 1], a[0, 1]])) # Prints "[2 2]"
```

```
import numpy as np

# Create a new array from which we will select elements
a = np.array([[1,2,3], [4,5,6], [7,8,9], [10, 11, 12]])

print(a) # prints "array([[ 1,  2,  3],
#                  [ 4,  5,  6],
#                  [ 7,  8,  9],
#                  [10, 11, 12]])"

# Create an array of indices
b = np.array([0, 2, 0, 1])

# Select one element from each row of a using the indices in b
print(a[np.arange(4), b]) # Prints "[ 1  6  7 11]"

# Mutate one element from each row of a using the indices in b
a[np.arange(4), b] += 10

print(a) # prints "array([[11,  2,  3],
#                  [ 4,  5, 16],
#                  [17,  8,  9],
#                  [10, 21, 12]])"
```

libraries Numpy SciPy Matplotlib

Numpy Array indexing

```
import numpy as np

a = np.array([[1,2], [3, 4], [5, 6]])

bool_idx = (a > 2) # Find the elements of a that are bigger than 2;
# this returns a numpy array of Booleans of the same
# shape as a, where each slot of bool_idx tells
# whether that element of a is > 2.

print(bool_idx) # Prints "[[False False]
#                  [ True  True]
#                  [ True  True]]"

# We use boolean array indexing to construct a rank 1 array
# consisting of the elements of a corresponding to the True values
# of bool_idx
print(a[bool_idx]) # Prints "[3 4 5 6]"

# We can do all of the above in a single concise statement:
print(a[a > 2]) # Prints "[3 4 5 6]"
```

x = np.array([[1,2,3], [4,5,6], [7,8,9], [10, 11, 12]])
v = np.array([1, 0, 1])
y = x + v # Add v to each row of x using broadcasting
print(y) # Prints "[[ 2  2  4]
          #              [ 5  5  7]
          #              [ 8  8 10]
          #              [11 11 13]]"
```

```
import numpy as np
```

```
# Compute outer product of vectors
v = np.array([1,2,3]) # v has shape (3,)
w = np.array([4,5]) # w has shape (2,)
# To compute an outer product, we first reshape v to be a column
# vector of shape (3, 1); we can then broadcast it against w to yield
# an output of shape (3, 2), which is the outer product of v and w:
# [[ 4  5]
# [ 8 10]
# [12 15]]
print(np.reshape(v, (3, 1)) * w)
```

```
# Add a vector to each row of a matrix
x = np.array([[1,2,3], [4,5,6]])
# x has shape (2, 3) and v has shape (3,) so they broadcast to (2, 3),
# giving the following matrix:
# [[2 4 6]
# [5 7 9]]
print(x + v)
```

```
# Add a vector to each column of a matrix
# x has shape (2, 3) and w has shape (2,).
# If we transpose x then it has shape (3, 2) and can be broadcast
# against w to yield a result of shape (3, 2); transposing this result
# yields the final result of shape (2, 3) which is the matrix x with
# the vector w added to each column. Gives the following matrix:
# [[ 5  6  7]
# [ 9 10 11]]
```

Random Variables & PDF

Random processes

Vector processes

$$\mathbf{m}_x = E[\mathbf{x}(n)]$$

autocorrelation matrix $\mathbf{R}_{\mathbf{xx}}(k)$

$$\mathbf{R}_{\mathbf{xx}}(k) = E[\mathbf{x}(n)\mathbf{x}^\dagger(n - k)].$$

The Fourier transform of $\mathbf{R}_{\mathbf{xx}}(k)$ is called the power spectrum or **PSD matrix**:

$$\mathbf{S}_{\mathbf{xx}}(e^{j\omega}) = \sum_{k=-\infty}^{\infty} \mathbf{R}_{\mathbf{xx}}(k) e^{-j\omega k}.$$

Random processes

Vector processes

Uncorrelatedness and orthogonality

Two random vectors \mathbf{x} and \mathbf{y} are said to be uncorrelated if

$$E[\mathbf{x}\mathbf{y}^\dagger] = E[\mathbf{x}]E[\mathbf{y}^\dagger]$$

and orthogonal if

$$E[\mathbf{x}\mathbf{y}^\dagger] = \mathbf{0}.$$

Random processes

Vector processes

Gaussian vector

$$f(\mathbf{x}) = \frac{1}{\sqrt{\det(2\pi\mathbf{C}_{\mathbf{xx}})}} e^{-\frac{1}{2}(\mathbf{x}-\mathbf{m}_{\mathbf{x}})^T \mathbf{C}_{\mathbf{xx}}^{-1} (\mathbf{x}-\mathbf{m}_{\mathbf{x}})}.$$

$$\mathbf{x} = [x_0 \quad x_1 \quad \dots, x_{N-1}]^T,$$

$$f_{X_0}(x_0) = \int_{x_1} \dots \int_{x_{N-1}} f(\mathbf{x}) dx_1 \dots dx_{N-1}$$

Linear Algebra for Signal Processing

A Good Notation For Vectors & Matrices

1. Bold-faced quantities denote matrices and vectors.
2. $|a|$ denotes the absolute value.
3. $\det \mathbf{A}$ denotes the determinant of \mathbf{A} .
4. $\text{Tr}(\mathbf{A})$ denotes the trace of \mathbf{A} .
5. \mathbf{A}^T denotes the transpose of \mathbf{A} .
6. \mathbf{A}^\dagger denotes the transpose-conjugate of \mathbf{A} .
7. \mathbf{A}^* denotes the conjugate of \mathbf{A} .
8. \mathbf{A}^{-1} denotes the inverse of \mathbf{A} .
9. \mathbf{A}^{-T} denotes the inverse of the transpose of \mathbf{A} .
10. $\mathbf{A}^{-\dagger}$ denotes the inverse of the transpose-conjugate of \mathbf{A} .
11. $\tilde{\mathbf{H}}(z) = \mathbf{H}^\dagger(1/z^*)$, and $\tilde{\mathbf{H}}(e^{j\omega}) = \mathbf{H}^\dagger(e^{j\omega})$.
12. $\|\mathbf{a}\|$ denotes the ℓ_2 -norm of the vector \mathbf{a} .
13. $W_M = e^{-j2\pi/M}$; subscript M is often omitted.
14. \mathbf{W} denotes the $M \times M$ DFT matrix with $[\mathbf{W}]_{km} = W^{km}$.
15. $\delta(n)$ denotes the unit pulse or impulse function; $\delta_c(t)$ denotes the Dirac delta function or impulse function.
16. \triangleq denotes “defined as.”

Inner products and norms

$$\mathbf{a} = [a_0 \quad a_1 \dots a_{M-1}]^T, \quad \text{and} \quad \mathbf{b} = [b_0 \quad b_1 \dots b_{M-1}]^T$$

$$\langle \mathbf{a}, \mathbf{b} \rangle = \mathbf{b}^\dagger \mathbf{a} = \sum_{k=0}^{M-1} a_k b_k^*.$$

$$\langle f, g \rangle = \int_0^T f(t)g^*(t)dt.$$

The vectors are said to be **orthogonal** if the inner product is zero, that is, $\mathbf{b}^\dagger \mathbf{a} = 0$.

$$\|\mathbf{a}\|_2 = (\mathbf{a}^\dagger \mathbf{a})^{1/2} = \left(\sum_{k=0}^{M-1} |a_k|^2 \right)^{1/2}$$

$$\|f(t)\|_2^2 = \int_0^T |f(t)|^2 dt.$$

$$\|\mathbf{a}\|_p = \left(\sum_{k=0}^{M-1} |a_k|^p \right)^{1/p}$$

$$\|f(t)\|_p = \left(\int_0^T |f(t)|^p dt \right)^{1/p}$$

Cauchy-Schwartz inequality

$$\left| \sum_{k=0}^{M-1} a_k b_k^* \right|^2 \leq \sum_{k=0}^{M-1} |a_k|^2 \sum_{k=0}^{M-1} |b_k|^2$$

$$\left| \int_{-\infty}^{\infty} f(t) g^*(t) dt \right|^2 \leq \int_{-\infty}^{\infty} |f(t)|^2 dt \int_{-\infty}^{\infty} |g(t)|^2 dt$$

$$|\langle \mathbf{a}, \mathbf{b} \rangle|^2 \leq \|\mathbf{a}\|_2^2 \|\mathbf{b}\|_2^2$$

$$|\langle f(t), g(t) \rangle|^2 \leq \|f(t)\|_2^2 \|g(t)\|_2^2.$$

The AM-GM inequality

$$AM = \frac{1}{N} \sum_{k=0}^{N-1} a_k$$

$$GM = \left(\prod_{k=0}^{N-1} a_k \right)^{1/N}$$

For a set of positive numbers a_k , $0 \leq k \leq N - 1$

$$AM \geq GM.$$

Matrices

In Statistical Signal Processing

Covariance Matrix of Phased Array Radar Signal

$$\mathbf{P} = \begin{bmatrix} 1 & 2+j \\ 1 & 3 \\ 2 & 4-j \end{bmatrix}$$

$$\mathbf{P}^T = \begin{bmatrix} 1 & 1 & 2 \\ 2+j & 3 & 4-j \end{bmatrix}, \quad \mathbf{P}^* = \begin{bmatrix} 1 & 2-j \\ 1 & 3 \\ 2 & 4+j \end{bmatrix}, \quad \mathbf{P}^\dagger = \begin{bmatrix} 1 & 1 & 2 \\ 2-j & 3 & 4+j \end{bmatrix}.$$

An $M \times M$ diagonal matrix with all diagonal elements

equal to unity is called the **identity** matrix, and is indicated as \mathbf{I}_M or simply \mathbf{I} .

upper triangular matrix:

$$\mathbf{P} = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 0 & 0 & 5 \end{bmatrix}$$

Matrices

\mathbf{P} is $N \times M$ and \mathbf{Q} is $M \times K$

$$[\mathbf{PQ}]_{nk} = \sum_{m=0}^{M-1} p_{nm}q_{mk}. \quad \mathbf{PQ} \neq \mathbf{QP}$$

Determinant and trace

$$\text{Tr}(\mathbf{P}) = \sum_k p_{kk}. \quad \text{Tr}(\mathbf{PQ}) = \text{Tr}(\mathbf{QP})$$

$$\det \mathbf{P} = \sum_{k=0}^{M-1} (-1)^{k+m} p_{km} M_{km}, \quad (-1)^{k+m} M_{km} \text{ is said to be the } \mathbf{cofactor} \text{ of } p_{km}.$$

singular if $[\det \mathbf{P}] = 0$, and **nonsingular** if $[\det \mathbf{P}] \neq 0$.

Matrices

Properties of determinants

1. The determinant of a diagonal matrix is the product of its diagonal elements.
2. The determinant of a lower or upper triangular matrix is the product of its diagonal elements.
3. For an $M \times M$ matrix \mathbf{P} , $[\det c\mathbf{P}] = c^M [\det \mathbf{P}]$, for any scalar c .
4. $[\det \mathbf{PQ}] = [\det \mathbf{P}][\det \mathbf{Q}]$, assuming \mathbf{P} and \mathbf{Q} are both square.
5. If any row (or column) is a scalar multiple of another row (column), the determinant is zero. If any row (or column) is zero, the determinant is zero.
6. If \mathbf{Q} is obtained from \mathbf{P} by exchanging two rows then $[\det \mathbf{Q}] = -[\det \mathbf{P}]$. The same holds if columns are exchanged.
7. $[\det \mathbf{P}^T] = [\det \mathbf{P}]$.
8. A matrix of the form

$$\mathbf{A} = \begin{bmatrix} \mathbf{P} & \mathbf{0} \\ \mathbf{0} & \mathbf{Q} \end{bmatrix}, \quad (\text{B.5})$$

where \mathbf{P} and \mathbf{Q} are arbitrary, is called a **block-diagonal** matrix. When \mathbf{P} and \mathbf{Q} are square matrices, we can show that $[\det \mathbf{A}] = [\det \mathbf{P}][\det \mathbf{Q}]$.

Matrices

Rank

The rank of a matrix \mathbf{P} is equal to the number of linearly independent rows in the matrix.

1. An $M \times M$ matrix is nonsingular (i.e., its determinant is nonzero) if and only if it has full rank, that is, its rank is M .
2. Let \mathbf{A} and \mathbf{B} be $M \times N$ and $N \times K$ matrices with ranks ρ_a and ρ_b . Let ρ be the rank of \mathbf{AB} . Then,

$$\rho_a + \rho_b - N \leq \rho \leq \min(\rho_a, \rho_b).$$

This is called **Sylvester's inequality**.

3. Given two square matrices \mathbf{A} and \mathbf{B} , the matrices $\mathbf{I} - \mathbf{AB}$ and $\mathbf{I} - \mathbf{BA}$ have identical rank. However, the products \mathbf{AB} and \mathbf{BA} may not have the same rank in general.

Matrices

Rank

The rank of a matrix \mathbf{P} is equal to the number of linearly independent rows in the matrix.

4. Given a $p \times r$ matrix \mathbf{P} , the space of all vectors of the form \mathbf{Px} is called the **range space** or column space of \mathbf{P} . The **dimension** of the range space (i.e., the number of linearly independent vectors in that space) is equal to the rank of \mathbf{P} . The **null space** of \mathbf{P} is the set of all vectors \mathbf{y} such that $\mathbf{Py} = \mathbf{0}$. It turns out that the set of all linear combinations from the range space of \mathbf{P} and the null space of \mathbf{P}^\dagger is equal to the complete space of all vectors of size p .

Matrices

Inverse of a matrix

Given an $N \times M$ matrix \mathbf{P}

if $\mathbf{PR} = \mathbf{I}_N$ then \mathbf{R} is a *right inverse* of \mathbf{P} ; this exists if and only if \mathbf{P} has rank N .

$$\mathbf{P}^{-1} = \frac{\text{Adj } \mathbf{P}}{\det \mathbf{P}} \quad [\text{Adj } \mathbf{P}]_{km} = \text{cofactor of } P_{mk}.$$

$$\mathbf{P} = \mathbf{AB} \quad \mathbf{P}^{-1} = \mathbf{B}^{-1}\mathbf{A}^{-1},$$

Eigenvalues and eigenvectors

the nonzero vector \mathbf{v} is an **eigenvector** of the $M \times M$ matrix \mathbf{P} if

$$\mathbf{Pv} = \lambda\mathbf{v}$$

The scalar λ is the **eigenvalue**

Matrices

Eigenvalues and eigenvectors

the nonzero vector \mathbf{v} is an **eigenvector** of the $M \times M$ matrix \mathbf{P} if

$$\mathbf{P}\mathbf{v} = \lambda\mathbf{v}$$

The scalar λ is the **eigenvalue**

characteristic equation $\det [s\mathbf{I} - \mathbf{P}] = 0.$

The determinant and trace of an $M \times M$ matrix \mathbf{P} are related to its M eigenvalues λ_k as follows:

$$\det \mathbf{P} = \prod_{k=0}^{M-1} \lambda_k \quad \text{and} \quad \text{Tr} (\mathbf{P}) = \sum_{k=0}^{M-1} \lambda_k.$$

Matrices

Eigenvalues and eigenvectors

\mathbf{P} has an eigenvalue equal to zero if and only if it is singular (determinant equal to zero).

\mathbf{P} and \mathbf{P}^T have the same set of eigenvalues including multiplicity.

For a (lower or upper) triangular matrix, the eigenvalues are equal to the diagonal elements. Diagonal matrices also have this property.

For nonsingular \mathbf{P} , the eigenvalues of \mathbf{P}^{-1} are reciprocals of those of \mathbf{P} .

If λ_k are the eigenvalues of \mathbf{P} , the eigenvalues of $\mathbf{P} + \sigma\mathbf{I}$ are $\lambda_k + \sigma$.

Matrices

Eigenvalues and eigenvectors

The matrix $\mathbf{T}^{-1}\mathbf{P}\mathbf{T}$ has the same set of eigenvalues as \mathbf{P} (including multiplicity). This is true for any nonsingular \mathbf{T} . The matrix $\mathbf{T}^{-1}\mathbf{P}\mathbf{T}$ is said to be a **similarity transformation** of \mathbf{P} .

Equivalent Statements:

1. \mathbf{P}^{-1} exists.
2. \mathbf{P} is nonsingular.
3. $[\det \mathbf{P}] \neq 0$.
4. All eigenvalues of \mathbf{P} are nonzero.
5. There is no nonzero vector \mathbf{v} that annihilates \mathbf{P} (i.e., makes $\mathbf{P}\mathbf{v} = \mathbf{0}$).
6. The rank of \mathbf{P} is M .
7. The M columns of \mathbf{P} are linearly independent (and so are the rows).

Matrices

Matrix inversion lemma

$$(\mathbf{P} + \mathbf{QRS})^{-1} = \mathbf{P}^{-1} - \mathbf{P}^{-1}\mathbf{Q}(\mathbf{SP}^{-1}\mathbf{Q} + \mathbf{R}^{-1})^{-1}\mathbf{SP}^{-1}.$$

Partitioned matrices

$$\begin{bmatrix} \mathbf{A} & \mathbf{B} \\ \mathbf{C} & \mathbf{D} \end{bmatrix} = \begin{bmatrix} \mathbf{I} & \mathbf{0} \\ \mathbf{CA}^{-1} & \mathbf{I} \end{bmatrix} \begin{bmatrix} \mathbf{A} & \mathbf{0} \\ \mathbf{0} & \mathbf{D} - \mathbf{CA}^{-1}\mathbf{B} \end{bmatrix} \begin{bmatrix} \mathbf{I} & \mathbf{A}^{-1}\mathbf{B} \\ \mathbf{0} & \mathbf{I} \end{bmatrix}$$

$$\det \begin{bmatrix} \mathbf{A} & \mathbf{B} \\ \mathbf{C} & \mathbf{D} \end{bmatrix} = \det \mathbf{A} \times \det (\mathbf{D} - \mathbf{CA}^{-1}\mathbf{B}).$$

Matrices

Matrices with special properties

1. A matrix \mathbf{H} is said to be **Hermitian** if $\mathbf{H}^\dagger = \mathbf{H}$. Equivalently, the elements are such that $H_{km} = H_{mk}^*$. Clearly \mathbf{H} has to be square for this. A real Hermitian matrix is said to be **symmetric** ($\mathbf{H}^T = \mathbf{H}$). Other related types include skew-Hermitian matrices ($\mathbf{H}^\dagger = -\mathbf{H}$), and antisymmetric matrices ($\mathbf{H}^T = -\mathbf{H}$). If \mathbf{H} is Hermitian, then *all its eigenvalues are real*, and moreover $\mathbf{v}^\dagger \mathbf{H} \mathbf{v}$ is real for all \mathbf{v} .
2. A matrix \mathbf{U} is said to be **unitary** if $\mathbf{U}^\dagger \mathbf{U} = \mathbf{I}$. Denoting the columns of \mathbf{U} by $\mathbf{u}_0, \mathbf{u}_1, \dots$, we see that unitarity implies

$$\mathbf{u}_k^\dagger \mathbf{u}_m = \delta(k - m).$$

That is, the columns are **orthogonal**. Moreover, each column has unit norm. Note that a unitary matrix need not be square; it can be $N \times M$ with $N \geq M$. If $N = M$, then \mathbf{U}^\dagger is also unitary, that is, $\mathbf{U} \mathbf{U}^\dagger = \mathbf{I}$. If \mathbf{U} is square and unitary then *all its eigenvalues have unit magnitude*.

3. The $N \times N$ DFT (discrete Fourier transform) matrix has the elements

$$[\mathbf{W}]_{km} = [W^{km}], \quad (\text{B.24})$$

where $W = e^{-j2\pi/N}$. This is a symmetric (but complex) matrix. The matrix \mathbf{W}/\sqrt{N} can be verified to be unitary, that is,

$$\mathbf{W}^\dagger \mathbf{W} = N\mathbf{I}. \quad (\text{B.25})$$

Matrices

Matrices with special properties

4. A matrix \mathbf{P} is said to be **Toeplitz** if the elements P_{km} are determined completely by the difference $k - m$. For example,

$$\mathbf{P} = \begin{bmatrix} p_0 & p_1 & p_2 \\ p_3 & p_0 & p_1 \\ p_4 & p_3 & p_0 \end{bmatrix} \quad (\text{B.26})$$

is Toeplitz. Thus, all elements on a line parallel to the diagonal are identical. The matrix need not be square.

5. An $N \times N$ matrix, each of whose rows has the form

$$[1 \quad a_m \quad a_m^2 \quad \dots \quad a_m^{N-1}], \quad (\text{B.27})$$

is called a **Vandermonde** matrix. An example is the DFT matrix described above. The determinant of a Vandermonde matrix \mathbf{V} is given by

$$\det \mathbf{V} = \prod_{m>n} (a_m - a_n). \quad (\text{B.28})$$

A Vandermonde matrix is nonsingular (determinant nonzero) if and only if the a_m 's are distinct. A vector of the form (B.27) is called a Vandermonde vector.

Matrices

Matrices with special properties

6. A square matrix is **right-circulant** if each row is obtained by a right-circular shift of the previous row as in the following 3×3 example:

$$\mathbf{C} = \begin{bmatrix} c_0 & c_1 & c_2 \\ c_2 & c_0 & c_1 \\ c_1 & c_2 & c_0 \end{bmatrix}. \quad (\text{B.29})$$

For a left-circulant matrix, each row is obtained by a left-circular shift of the previous row. A generalization of the circulant is the **pseudocirculant** matrix, which we discuss in Appendix D. Note that circulants are also Toeplitz.

7. If \mathbf{C} is $N \times N$ circulant, then $\mathbf{C} = \mathbf{W}^{-1} \mathbf{\Lambda}_c \mathbf{W}$, where \mathbf{W} is the $N \times N$ DFT matrix and $\mathbf{\Lambda}_c$ is diagonal. So the columns of \mathbf{W}^{-1} are eigenvectors (equivalently the columns of \mathbf{W} , which are the columns of \mathbf{W}^{-1} renumbered and scaled by a constant).

Matrices

Matrices with special properties

8. A matrix \mathbf{P} is said to be **normal** if $\mathbf{PP}^\dagger = \mathbf{P}^\dagger\mathbf{P}$. Clearly \mathbf{P} has to be a square matrix. It can be shown that \mathbf{P} is normal if and only if it can be diagonalized by a unitary matrix, that is,

$$\mathbf{U}^\dagger \mathbf{P} \mathbf{U} = \Lambda \quad (\text{B.30})$$

for diagonal Λ and unitary \mathbf{U} . Since the columns of \mathbf{U} are eigenvectors, we see that normal matrices can also be defined to be those for which there exists a complete set of mutually orthogonal eigenvectors. It can be shown that the following are examples of normal matrices:

- (a) Hermitian matrices;
- (b) skew-Hermitian matrices;
- (c) unitary matrices;
- (d) circulants.

So these can be diagonalized by unitary matrices, even if the eigenvalues may not all be distinct.

Matrices

Positive definite matrices

$$\mathbf{v}^\dagger \mathbf{P} \mathbf{v} > 0$$

For any $N \times N$ matrix \mathbf{P} , the scalar

$$\phi = \mathbf{v}^\dagger \mathbf{P} \mathbf{v} \tag{B.35}$$

is said to be a **quadratic form**, where \mathbf{v} is a column vector. When \mathbf{P} is Hermitian, $\mathbf{v}^\dagger \mathbf{P} \mathbf{v}$ is guaranteed to be real. If the Hermitian matrix \mathbf{P} is such that $\mathbf{v}^\dagger \mathbf{P} \mathbf{v} > 0$ for $\mathbf{v} \neq \mathbf{0}$, we say that \mathbf{P} is positive definite. If $\mathbf{v}^\dagger \mathbf{P} \mathbf{v} \geq 0$ for all \mathbf{v} , then \mathbf{P} is positive semidefinite. Negative definiteness and semidefiniteness are similarly defined. If \mathbf{P} is positive definite, we write it as

$$\mathbf{P} > \mathbf{0}, \tag{B.36}$$

Matrices

Positive definite matrices

$$\mathbf{v}^\dagger \mathbf{P} \mathbf{v} > 0$$

1. **Relation to eigenvalues.** The Hermitian matrix \mathbf{P} is positive definite (semidefinite) if and only if all the eigenvalues are positive (non-negative).
2. **Relation to minors.** The Hermitian matrix \mathbf{P} is positive definite if and only if all *leading principal minors* of \mathbf{P} are positive, and positive semidefinite if and only if all *principal minors* are non-negative. In particular, therefore, all diagonal elements of a positive definite (semidefinite) matrix are positive (non-negative).
3. **Square root factorization.** It can be shown that any $N \times N$ positive semidefinite \mathbf{P} with rank $\rho \leq N$ can be factorized as

$$\mathbf{P} = \mathbf{Q}^\dagger \mathbf{Q}, \quad (\text{B.39})$$

where \mathbf{Q} is $\rho \times N$. The factor \mathbf{Q} is called a **square root** of \mathbf{P} . One technique to find such a factor \mathbf{Q} is called *Cholesky decomposition* [Golub and Van Loan, 1989], which produces a lower triangular square root. When \mathbf{P} is positive definite, it has full rank ($\rho = N$), and the square root \mathbf{Q} is square and nonsingular. Conversely, a product of the form $\mathbf{Q}^\dagger \mathbf{Q}$ is positive semidefinite for any \mathbf{Q} , and positive definite if \mathbf{Q} has linearly independent columns (e.g., when \mathbf{Q} is square and nonsingular).

Matrices

Positive definite matrices

$$\mathbf{v}^\dagger \mathbf{P} \mathbf{v} > 0$$

4. **Determinant and diagonal elements.** Let \mathbf{P} be $N \times N$ Hermitian positive definite, and let P_{ii} denote its diagonal elements. Then

$$\det \mathbf{P} \leq \prod_{i=0}^{N-1} P_{ii}, \quad (\text{B.40})$$

with equality if and only if \mathbf{P} is diagonal. This is called the **Hadamard inequality**.

Matrices

Rayleigh-Ritz principle

Let \mathbf{P} be $N \times N$ Hermitian

smallest and largest eigenvalues,

$$\max_{\mathbf{v}^\dagger \mathbf{v} = 1} \mathbf{v}^\dagger \mathbf{P} \mathbf{v} = \lambda_{max}.$$

$$\min_{\mathbf{v}^\dagger \mathbf{v} = 1} \mathbf{v}^\dagger \mathbf{P} \mathbf{v} = \lambda_{min}.$$

Singular value decomposition

$$\mathbf{A} = \underbrace{\mathbf{U}}_{P \times P} \underbrace{\mathbf{S}}_{P \times M} \underbrace{\mathbf{V}^\dagger}_{M \times M},$$

where \mathbf{U} and \mathbf{V} are unitary matrices, that is,

$$\mathbf{U}^\dagger \mathbf{U} = \mathbf{U} \mathbf{U}^\dagger = \mathbf{I}_P, \quad \mathbf{V} \mathbf{V}^\dagger = \mathbf{V}^\dagger \mathbf{V} = \mathbf{I}_M,$$

and \mathbf{S} is a diagonal matrix with real non-negative diagonal elements $\sigma_k \geq 0$.

The diagonal elements σ_k are called the **singular values** of \mathbf{A} .

Left inverse computed from SVD

$$\mathbf{A}^\# = \mathbf{V} [\Sigma^{-1} \quad \mathbf{0}] \mathbf{U}^\dagger.$$

$$\mathbf{A}^\# = (\mathbf{A}^\dagger \mathbf{A})^{-1} \mathbf{A}^\dagger$$

$$\mathbf{A}^\# = \mathbf{A}^\dagger (\mathbf{A} \mathbf{A}^\dagger)^{-1}.$$

Singular value decomposition

Frobenius norm and SVD

$$\|\mathbf{A}\|^2 = \sum_{k=0}^{P-1} \sum_{m=0}^{M-1} |a_{km}|^2.$$

$$\|\mathbf{A}\|^2 = \text{Tr}(\mathbf{A}^\dagger \mathbf{A}) = \text{Tr}(\mathbf{A} \mathbf{A}^\dagger),$$

$$\|\mathbf{A}\|^2 = \sum_{k=0}^{M-1} \sigma_k^2.$$
